: Khz?) .. Would it be possible to replace the crystals to change the freqs?
: Ideally I'd like to be able to select channel numbers (1-25). Could I use a

The crystals used work on the third overtone. 16.61 MHz is the transmit
xtal 3 x 16.610=49.830. 16.45833 is the receive xtal. 16.45833 x 3 =

49.37499, call it 49.375. The 49.375 mixes with the received 49.830
to produce a 455 kHz IF signal.

The crystals can be replaced with others using that method of calcualation
backwards to find the new xtal freqs required to operate on a particular
channel, remembering, of course, any requirement for licensing that might
exist. It would be hard to keep two different adjustable oscillators
tuned properly to transmit and receive. To operate easily, you would
need to build a Phase Locked Loop oscillator, together with the
proper controls to choose the required divisor ratios.

something like that. if i remember right the 3m/ryan stormscope was basically an ADF receiver (to get bearing) and they did some stuff to arrive at a "distance" number - somewhat proportional to amplitude (a strong strike far away shows closer than it really is..)

You can get all the details of the WWV coding from NIST in Boulder
Colarado. Spectracom in Rochester New York did make and I think still
makes a receiver for WWVB at 60 KHz. It will give accurate time and
frequency.

1708. When silence is golden, or, Re: IC-726 freq. mods...

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-15 00:00:00 UTC
From: tiemann@spot.Colorado.EDU
Message-ID: <4ict4o$5b9@peabody.colorado.edu>
Source record: 106786

Looking more closely at the schematics of my IC-726 as a result of earlier in this thread, I noticed something interesting and would like to share... In short, silence might be golden.

There's this diode, D5 you can clip to convert the thing from ham-bands-only MF-HF TX to general coverage TX. They don't mention this in the instruction manual, naturally. However, D5 is right there on the schem., with all its neighbors. They connect various pins on a CPU to one another, with opaque names like "Y0,Y1,Y2...Y7," and "DB0...DB7" similarly. Also, there's an NPN transistor switch feeding each of these places too, same as where the diodes go. Here comes the silence: _ALL_ _BUT_ _ONE_ of the transistors are given plain-text functions:"CI-V bus check; mic ck; mic ud (up-down, presumably); tuner on; RIT data; and KEY"... and following this unnamed one around all over the circuit there is NEVER a plain text description of what it's for.

_____
Guess what? This one's connected to D5. General Coverage TX, I guess.

Now let's turn to the instruction manual.

These diodes have logic functions. There's a section on the remote-jack "Communication Interface" (CI-V) region of the circuit, and depending on what address you want to call the radio from an external computer's point of view depends on installing or removing some diodes around there. (They say the IC-726 comes with a default address of 30H (48).) So there's a sketch of all the diodes, labeled, and a little table of which diodes do what, etc... and some diodes are drawn in that aren't actually there - you have to install them - and other diodes that ARE there aren't drawn - they're irrelevant to the discussion at hand. *EXCEPT ONE*. D5, again, is mysteriously drawn in, and it *is* *actually* present, but it *is not* mentioned anywhere in that section - or anywhere else so far as I have found.

Now that I know what D5 is for - and I've clipped it - their silence is deafening.

Listen carefully! There might be some good stuff there.

I recall the NE602 has a very poor IP3, like -15dBm, though it
has a bunch of gain. I personally wouldn't use one in a front
end without a very, very selective front end filter. If you
insert most of the selectivity between the pre-amp and the mixer,
you can maintain a decent NF...

Your only concern would be that you'd need to turn down the output
from the Hands rig to something that a typical 100-watt-class solid-
state amp would like to see. The most common "kit" solid-state
amp (not really a kit, but a board and a parts list) likes to see 4
watts or so for 100 - 150 watts out. This is based on the old
Motorola 140 watt push-pull HF amp designed by Helge Granberg about
a million years ago. These are easy to build. You can probably
locate one of these already assembled if you know where to look.

>M1*V1=M2*V2, where M1 and V1 are the sail's mass and velocity
>and M2 and V2 are the photon's mass and velocity. Setting M2 to
>zero yields zero momentum transfer.

you have to balance *momentum*. in this case, we have two items:
the photon and the mirror:

p(photon_in) = p(photon_out) + dp(mirror)

if we limit ourselves to a normal reflection, the p(photon_out)
equals -p(photon_in), so the change in the mirror's momentum is:

dp(mirror) = 2*p(photon_in)
= 2E/c, E = energy of the photon

the sail will be intercepting many ka-billions of photons per unit time.
let us call this flux 'n' photons/second, and as a force is the change
of momentum per unit time:

F(mirror) = 2*n*E/c

however, it is easier to measure measure the power per unit area
(about 1500W/m^2 at 1au from the Sun), call this 'S', and let the surface
area of the mirror, 'A', enter into the equation:

F(mirror) = 2*S*A/c

and while the defintion of 'S' was introduced as the power per unit area
from the source, it should be understood that S is really how much of this
power the mirror can reflect (which is a function of wavelength and
material). left as an exercise for the curious reader is to consider
non-normal incidence, handle the case of photon's that are absorbed by the
mirror, and (bonus) determine the orientation a solar sail ought
to be in order to maximize energy gain, if this mirror is in solar orbit.

I've been tin plating for awhile now at home. I buy a kit sold at my local
electronic supply store (Norvac). The kit is comprised of two parts:
a tin salt of some sort (stannous chloride maybe? I can't remember), and
a fluid (I can't remember if the liquid is an acid or a base). The kit is
distributed by Kepro. You can usually find ads for Kepro in Nuts and Volts,
or Electronics Now. They also sell the transfer film used for making
circuit boards from your laser printer.

>
>And there is no such thing like a NF evaluation...

Actually, I may have the same Motorola book (DL126, Q4/87, rev. 1),
and the J310 data sheet refers to the U310 data sheet for charts.
The chart for NF and Gpg v. frequency goes down to 50MHz (bottom
right of page 6-186). The NF is 1dB, Gpg is 20dB. These numbers
were apparently measured in a test circuit intended for 450MHz,
and it may be possible to get a better noise match.

The MPF102 is essentially a 2N4416, and the data for this part
suggests that the J310 has a lower NF (about .5dB) and a
significantly stronger IP3 (at least 10dBm better).

What kind of mixer are you going to use after the FET preamp?
If I were using a diode mixer with maybe 7dB of insertion loss,
I'd tune the preamp for maybe 9dB of gain, and the U310 data
sheet suggests the IP3 would be around +29dBm!

1724. Re: Looking for CK722 Transistor

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-15 00:00:00 UTC
From: au156@yfn.ysu.edu
Message-ID: <4icgqg$7qh@news.ysu.edu>
Source record: 106802

Well, it's been interesting and certainly nostalgic to hear people recalling the early Raytheon CK722 transistors and the varying colors of cases that they were apparently made in over the years.

I can attest to the deep blue *and bare aluminum* case styles, since I have specimens of both.

I consulted a wonderful 116 page book called "RAYTHEON Transistor Applications: More than 50 practical Circiuts using Raytheon CK722 Transistors", for a few more factoids. Price for this book: 50 cents. (no date marked, unfortunately, but probably easily before 1959).

Inside the front cover is an aerial photograph of "The home of Raytheon transistors", what apppears to be a brick three story mill building, complete with smoke stack.

"This multimillion dollar plant is the largest in
the world devoted exclusively to the production
of semiconductors."

Somewhat ironically, the address is *California* Street, Newton, Massachusetts.

Turning to the spec sheets at the back of the book, there were four transistors available in the characteristic CK722 case style: CK721, CK722, CK725, and CK727. The differences in the first three seem to be mainly variations in current gain, while the CK727 was optimized for lower (AF) noise:

Type "Average base current
amplification factor"

CK721 45

CK722 22

CK725 90

CK727 25

At the time of publication, Raytheon also offered about 11 conventionally identified germanium PNP point contact transistors, from the 2N63 to the 2N133, not all of which were hermetically sealed. (None of the above CK series were hermetically sealed)

Those were great times back then! New thread idea: remember the International Rectifier B2M photocells?

Hi Robin;

Your circuit uses a capacitive divider to transform the impedance at pin 1 to the lower impedance of the 50 ohm source.

The formula for R(in) = Q * Reactance of L

2
{[C2(220pf)/ C1 (47pf)] + 1}

You've been given R(in) as 1500 ohms. Reactance of L is 2pi F(45 E6) L (.28 E-6). I leave it to you, the industrious student to work the numbers thru to find the assumed Q.

Other significant circuit descriptions are:

The big cap to ground is just an RF bypass, the inductor serves as a dc return between pins 1 and 2.

Impedance matching is important for termination of transmission lines to avoid a reflection (echo / standing wave) coefficient, and when a high impedance source will be severly loaded by a low impedance load. If the source is low impedance (as represented by a constant voltage source) and the load is high impedance, (as represented by a constant current load), matching, as a practical matter is not nearly as important.

Dana,

: The MPF102 is essentially a 2N4416, and the data for this part
: suggests that the J310 has a lower NF (about .5dB) and a
: significantly stronger IP3 (at least 10dBm better).

Thanks.
Maybe I'll use a BF 998 though (yes, yes, a European part !) :-)

: What kind of mixer are you going to use after the FET preamp?

A NE 602 I think. It has good charcteristics at ~ 45 MHz.
And low NF (4.5 dB)

Vincent

Dana Myers (myers@West.Sun.COM) wrote:

(in response to Vince's search for an FET that's characterized
well at 50MHz...)

: What kind of mixer are you going to use after the FET preamp?
: If I were using a diode mixer with maybe 7dB of insertion loss,
: I'd tune the preamp for maybe 9dB of gain, and the U310 data
: sheet suggests the IP3 would be around +29dBm!

This reminds me of a design that Macintosh used in FM tuner front ends
many years ago. I wonder if any readers here have taken a close look at
that circuit or one like it. As I recall, it used an FET with fairly
high Idss in cascode with a transistor designed for CATV amplifier
service, so the FET kept a low voltage drop (and therefore reasonable
power dissipation), and the CATV transistor allowed a relatively high
voltage and current collector supply. Supposedly it was very forgiving
of large input signals, but of course folk who buy FM tuners don't
generally look for an IP3 spec, so none was given that I recall. But
maybe someone here can comment on how well a circuit like this really
works.

Hi.
I have an ICOM GP22 GPS and with it the Magnetic base type
antenna.
The magnetic antenna is fine for mobile work but I have used
the same antenna positioned up on the instrument panel of
my aircraft with disastrous results to my compass, even though
the antenna was situated about 500mm away from it!
I was wondering is it possible to homebrew a small vertical type
of antenna that I can mount with a suction cap to the windscreen
of the aircraft?

>Number is not in service.

Doesn't work from S. Calif either. It is possible that it works
locally someplace. Not all 800 numbers are nation-wide. Some of
them are re-used several times in different markets.

I haven't seen any follow-up posts from James Moore, either.
Is this some sort of sophomoric "humor"?
Good grief! look at all those newsgroups!

Hi Peter,

The last element in each of the filters that goes to the common port MUST be a series element AND the element will be capacitive on the 6M filter and inductive on the HF filter. This way the 6M filter presents a hi Z to HF and vice versa. Failure to recognize this will lead to squirrly response in both passbands.

> that uses this ic.The input to the mixer of the ic is from a 50 ohm source.

> Can anyone out there tell me how these values are calculated.The frequency of interest
> is 45Mhz

This circuit is just a parallel resonant circuit with tapped capacitor
("capacitor divider") matching. The series combination of C1 and C2 must
resonate L at the frequency of interest. Also The impedance ratio from
Rin to Rout is roughly the square of the ratio of C2/C1 (the precise
ratio
is a bit more complex, but this estimate will get you pretty close).

The bandwidth of the circuit is a function of the loaded Q, which is
calculated
from:
QL= Rout/XL
where: XL = 2*PI*F*L

```
-----------------------
| |
| |
C1=47pf --- |
--- )
________| ) L Rout = 1500
Rin=50 | )
--- )
--- |
C2=220pf | |
| |
-------------------------------
```

In your example circuit, C2/C1=4.68.
4.68 squared=22, so this circuit will transform 50 ohms
up to about 1100 ohms. The inductance of L resonates the series
combination of C1 and C2 at about 48 MHz. The IC probably has
about 10 pf of internal capacitance which adds to the total
circuit C to reduce the resonant frequency to 45 MHz.

Best I can determine, Icom doesn't include much technical info,
the remote is more than an antenna. It appears to be a complete
duplicate of the RF portion of the GPS unit. You'll note that
it communicates with the handheld unit via ordinary multiconductor
cable, not via coax suitable for 1.5 GHz. So you can't just replace
it with another antenna.

Looks like your options are to remove the magnet from the remote,
or just suction cup the GPS itself up on the dash and leave the
remote for use as it was intended. Or do what I did and buy a
Garmin. Its remote antenna only has a preamp in it, not an entire
receiver. If you use low loss coax (I use a short length of Andrew
Superflex), you can use just an antenna with it, the preamp is just
to overcome the loss of the RG-174 from the remote antenna to the
receiver (careful though, power is phantomed up the coax, the antenna
can't be a grounded plumbers delight, GPS antennas are usually of
patch construction, or quadrafilar helixes, but a 1/4-wave vertical
can work).

Another benefit of switching to the Garmin is that it's much
easier to use, and it tracks better when you are maneuvering.
The IC-22 sometimes loses position track when you do a 360,
and takes up to a minute to recover.

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

"Those were great times back then! New thread idea: remember
the International Rectifier B2M photocells?"

Ah-h-h, the ol' B2M photocell, I tried making an "electric eye" with the B2M and the CK722 (the deep drawn aluminum can version) the '722 was so leaky that I never could get the B2M's output to overcome the "load" I had to hang on the '722's base to drain away the leakage! I was 10 years old or so then. I finally used a CdS cell I got at Olson's on Main Street in Buffalo.

I also remember selecting out CK722's to find one that would oscillate at the high end of the AM broadcast band.

I've a few CK722's, 2N170's and even a Bell Telephone Labs Type 1A transistor - with these specs handwritten on the box:
Insertion gain 24 dB (freq = ??)
Emitter current: 1.1 mA
Collector current: 3.0 mA
Looks like the CK722's leakage wasn't too bad after all!
These goodies are in a box right next to my Intel 1103 and 4004! (yes, a box with Intel inside!)
Best regards to all, John Ramsey

Rat Shack has a simple 8 pin DIP IC that does just this, I think
it is $1.19. Just needs a capacitor to set the time constant and
a resistor I believe. It is a nice one since it lets you control the
flash rate and can be used for other things.
You could also use an astable multivibrator. Just bias two BJT's, then
set the time constant with some caps. I don't want to do the ASCII
schematic, email me if you want more info.

I make a linear to hf bands, and I used four 6KD6 tubes, with 1300V
and 1 amper. My tubes is now burred.
I want a new tubes and I think that I doubler the voltagem = 2800 V
and 0.5 ampers I can use a one 3 - 500 z tubes.
I ask by any especialist what do you think about my decision ?

Hardly. Resistance has units of length. When I talk about momentum, it has
units of inverse length. You can't prove anything about the photon by
looking at what units a particular measurement of it carries.

>Of course velocity isn't zero, by definition it is c. But mass
>is still left unaddressed. Rest mass of the photon is zero, again
>by definition, but a mass equivalence must be there in order for
>momentum to be non-zero. It is the derivation of that mass equivalence

You are hung up on this idea of mass equivalence. Physics thinks
differently. Photons simply carry momentum, like a travelling EM wave
carries momentum. Photons have no mass, no mass equivalent, *nothing*.
They are simply a measurement of a Fourier mode of an EM wave.

The CK722 came in both an natural aluminum case and a blue case. I had one of each when I was in 8th grade. But I broke the leads on the blue one and don't have a clue where it or the other one went. When combined with a 1N34 diode they sure beat a chunk of galena and a cats' whisker in a crystal radio.. I still have the piece of galena!

i can never find my digi-key catalog when i need one..harumph.

i believe the absolute easiest way to do a blinking LED would be to get one with the blinker in the LED package. Litronix made these - i would think there'd be some volume of business for that to keep 'em around.

alternately, you could build up an oscillator using a nand or nor gate and an RC feedback network to set flash rate and have the LED connected to the output.

Greetings all,
I am new to the world of ham radio (don't even have my license yet), and I'm working on setting up a station. I'm gonna need an antenna to work at least the entire HF range, and maybe thru 2m. I live on the second floor of a 2-flat, and space outside is limited... I've been figuring I'd put up a loop around my ceiling (approx. 12'x12') or on one wall (similar dimensions), use a transmatch, and hope for the best. Maybe someone out there has a better idea... It would be convenient if there were a way I could wire something up in my room or (for lower frequencies) outside my window... It may not be practical to raise anything up above the top of the building -- will this affect propagation in the HF range?? I _may_ be able to find a way to set up a horizontal dipole that is supported a few inches above the edge of the roof, so that obstructions are less of a problem. Anyone have any suggestions?? Also, I will need plans for a versatile, INEXPENSIVE Transmatch. I can probably tolerate somewhat high levels of SWR, if it will reduce design cost. Is it feasible to wire several toroid-core broadband transformers, and switch them in and out appropriately for each band?? I'd like not to have to retune the antenna every time I switch bands, and if I could have a knob that did that it would be quite nice..... PLEASE RESPOND (pref. by E-mail or E-mail+post) IF YOU CAN ANSWER ANY OF MY IGNORANT QUESTIONS!!! Thanks a lot everybody.

73's
Isaac Kohn

P.S. I actually am doing things in the wrong order, as I haven't built any sort of equipment that would utilize an antenna yet. If anyone has any diagrams/ideas for a receiver, and maybe a transmitter, that I could use for phone (at least AM, SSB would be nice), they would be much appreciated. Receiver might just be antenna, tank circuit shunting unwanted stuff to ground, single-diode detector, and high-gain AF AMP. This is good because I've already built a 1W output AF AMP, and it works great. Xmitter is tough because I only want to use one oscillator, but I want to span entire HF range. Prob. with both is switching components in tuned circuits for different bands.... Help is much appreciated. As you can see I am very unexperienced and am dying to get on the air. Thx again in advance!

From: j-macfar@uwe.ac.uk
Message-ID: <1996Mar18.161050.2412@pat.uwe.ac.uk>
Source record: 106689

Thanks for all the replies I received via e-mail concerning increasing the frequency range of a Yaesu FT-411.

It looks like you have to press the up and down buttons together while turning on the power. Unfortunately, this didn't work on my rig for some reason. So I went inside the rig to do the hardware varsion of this which involves changing some of the internal jumper settings.
Information on how to do this(and lots of other stuff) can be found at ftp oak.oakland.edu in the directory: pub/hamradio/mods/yeasu. This site has lots of other cool ham stuff aswell.

Anyway, I can now tune 130-185 MHz (although my rig is pretty dead at frequencies over about 147 MHz. This could be because its a UK version. Our 2m badn only goes 144-146. I belive in the States this is 144-148MHz. My main reason for doing this mod is for when I use my 2m rig with a Microwave Modules 2m-70cm transverter - the 432 MHz band is much bigger than the previously limited 2MHz range of my transceiver.

Thanks again,
James.

1763. Ten-Tec 1220 2m FM xcvr kit -- anyone built it yet?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-18 00:00:00 UTC
From: QRP%mimi@magic.itg.ti.com
Message-ID: <4ikc9k$a0r@mksrv1.dseg.ti.com>
Source record: 106691

I was wondering if anyone else had bought and built
the Ten-Tec 1220 2m FM transceiver kit yet. I was
apparently one of the first to get one. I built it
a few weeks ago, but I don't have it working yet.

Construction was quite easy. The manual was pretty
good, especially by today's kit-manual standards.
Only one missing part (a common 1/4-Watt resistor),
no mis-marked parts, no damaged parts, everything
fit where it was supposed to. Very nice quality
PC board: double-sided, solder-plated, plated-thru
holes, lacquer-masked, silk-screened. Wow!

Alignment was a breeze. Receiver works fine (but
it's not real selective and is subject to overload
from high-power commercial services and pagers).

I am getting no RF output from the PA, although I
can hear the transmitter signal, on-frequency, on
another 2m rig or handheld loud and clear. There
is obviously something "dead" in the transmitter
chain after the last mixer. I'll eventually find
the problem (haven't had time to look into it).

The 1222 amplifier module is built, but not tested
yet because no drive from the transceiver yet.

Has anyone else been-here-done-this yet? Respond
here on the newsgroup, as I'm sure inquiring minds
want to know!

73 from Texas! Dean, KC5NG

1764. fuses vs. circuit breakers vs. polyswitch

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-18 00:00:00 UTC
From: Tom Kreyche <tkreyche@well.com>
Message-ID: <4ik0es$5kb@nkosi.well.com>
Source record: 106692

I'm rewiring my sailplane and am trying to figure out how to protect the electrical system.

It has two 8 AH 12v gel cells, no charging system, a few low current instruments (a couple hundred mA) and a radio which draws an amp or so on tx.

None of electronics are critical to aircraft operation so the primary goals are: prevention of short circuit induced fires and instrument protection. The instruments need to run as long as possible while the batteries discharge.

Circuit breakers appear to have a voltage drop of about 1.5 v which minimizes useful battery life, so it appears to be a bad option for a system which isn't charging continuously. Fuses would be difficult to change in flight but have obvious advantages of little voltage drop, cheap, etc.

My plan is to fuse both + and - on the batteries as close to terminals as possible, use fairly high value fuses to protect against shorts, say 10 or 20 amps. They can't be changed in flight, but if one blows, I can switch to the other battery.

The next question is what to do about individual instruments. Nothing? or fuse each one? or put Raychem PolySwitches on each one? They're listed in Digi-Key, are cheap and have minimal resistance.

Any suggestions?

Thanks, Tom KG6YJ

Although Heathkit no longer is in the general kit business, they are still in the education business. One of their products is an updated version of the GC-1000 along with a remote clock that is driven from it. I forget if they are available as kits, but I expect that the manuals are available.

Have Fun,
Brooke

Does anyone have some pointers on modifying a cb for 10m output? Would one have to use transverters of some sort, or could you tune the radio internally down to 10m? I have a couple of rat shack 11m good for nothing cb's laying around and need a use for them. Thanx in advance.

: has a bunch of gain. I personally wouldn't use one in a front
: end without a very, very selective front end filter. If you
: insert most of the selectivity between the pre-amp and the mixer,
: you can maintain a decent NF...

Hmmm... That's true of course. Well, I can also use a mixer made
by MiniCircuits. They work well, I think.

By the way, if I use a 10 dB pre-amp gain, with noise figure < 1 dB,
- 15 dBm shall translate at the real input as -25 dBm.
Now, what source could produce -25 dBm. Let us see :
P(r) = P(e) * l^2 / (2 * pi * R)^2, no ?
That is log Pr = log Pe + 2 log l / (2 * pi * R)
Setting log Pr as -2.5 , log Pe as +5 (100 W dBm), l = 6 m
assuming 2 * pi = 6 (roughly), we get -7.5 = 2 log 1/R or log R = 4
R = 10 km... Mmmm... quite remote :-(

Maybe the NE 602 is not such a good choice :-) Unless I made a mistake !

W> wear surface as good or better than silver.

I should jump in here and comment that the relative merits of copper vs silver go well beyond the quality of the contact. Copper, for instance, has this nasty habit of arcing (your self-cleaning) under higher powers and thereby welding it together hard enough that your usually large enough switching solenoids, designed to do the switch in 10 milliseconds, sized and powered accordingly, will be utterly destroyed in 500 millseconds due to the welded contacts. SOLID silver, such as Zenith (the power switch folks, not the tv ones) used in 1" square by about 1/8" thickness in their 600+ amp switches, suffer no such effects.

We're talking normal 60 hz power switches here, but for rf at the power levels I deal with, the situation doesn't change that much. We still use silver plated bullets in our transmission line joints. The plating there is over brass for its spring action, and it plugs into the inner copper conductor with many pounds of force. Once the silver is gone from thermal expansion wear, then they start trying to weld a connection. Its rather like waiting for the 'other shoe' to fall if those lines are over 20 years old and the silver is long since worn away. In doing repairs, I've seen bullets with 1/8" globs of copper burned into them, and of course inches missing from the end of the inner conductor. Messy to clean up, and obviously expen$ive.

Tin or solder btw is a very poor materiel IMH unless you are willing to exersize the joint often enough to keep it clean of surface oxides. To do that has been a pain in my butt, and even then has required a semi-annual re-application just to replace the oxidized, blackened surface with fresh clean stuffs. In a card edge situation, the sockets contacts more than likely won't have enough bite to keep it cut thru the oxides. I think the word for a good connection over time is 'gas tight'. This requires the sort of pressures applied by a good crimping tool such as a Kings, AMP's better ones or T&B's.

Failing that, the card edge only becomes a good connection over a long period of time when both the finger pattern on the card, and the sockets contacts are gold flashed. A microns worth is usually fine.

My transmitter, a 35 year old GE, has nearly everything silver plated that has to do with the tuning. I don't tune it very often, and then usually only to restore the tuning that changing brands of tubes in that socket requires. Those chinese 4cx250b's that are all over the place now have lots more C than the eimacs. Treated right, they also outlast them by 3/1! When I say treated right, my visual final has been in that socket for 6 years! Its water cooled, and has been out of the socket once to change a base gasket in that time. Barring a major accident with it, it might well be there yet in 2002 when I retire.

Just a broadcasters $.02 worth. Cheers All

Don't have the mag I'm afraid, but I believe that to charge a Sealed
Lead Acid (Gel) battery you need a constant voltage charger with current
limit.

Which one of the two different voltage ranges you use depends on what you
plan to use the battery for. The charger doesn't have to switch between
them automatically. You simply decide the appropriate one and use that.
You charge at the higher voltage (14.2-14.4) if you use the battery
cyclicly (ie heavy discharge followed by charge). You use the lower charge
voltage (13.6-13.8) if you use the battery for standby use, ie it stays on
trickle charge nearly all the time except the odd occasion when you need
to use it (eg when the mains power fails). Also, for gel lead acids, the
charger should limit the maximum current that can flow to about 1/4 of the
battery's Ah rating.

Bearing this in mind, you could temporarily use a bench power supply as
a charger or modify a bench PSU article from another magazine ?

Hope this helps,
James.

In 1973, HAL Communications Corp. sold an MKB-1 Morse Keyboard and a KB-ID1 Keyboard Identifier. Does anyone remember these devices?

After building them from kits, they worked well. Recently I tried to change the call sign in the Identifier without success. There appears to be a race problem in the design.

Does anyone remember these devices? -The problem that makes the Identifier pattern sensitive? -A fix?

How many grandmothers do you know with 800 phone lines?

Worse than playing. Sounds like indirect harrassment of some
commercial entity. Stick them with a bunch of useless phone
calls that they have to pay for. And using newsgroups with a
large audience of collectors, bargain hunters, and wheeler-dealer
types that are guaranteed to call and leaving out any description
of the goods is pretty firm evidence.

Not true, the frequencys from 144.100 to 148.000 MHz
are allocated for CW, Voice, SSTV, FAX, and RTTY. With
144.000 to 144.100 MHz for CW only.

P.S 146.000 MHz is the middle of the 2m band.

Mr. Gunn, You should peruse the local hamfests, an old 2m AM rig can
usually be had for a song (and about $30 - $40)

Tim, ka8ddz

You may want to rethink this one. There are other modes allowed on 2M,
SSB and CW are used quite a bit in that band.

1783. Conversion of noise voltage into noise figure ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-19 00:00:00 UTC
From: elendir@enst.fr
Message-ID: <4im80h$h61@tempo.univ-lyon1.fr>
Source record: 106709

Hi, that's me again :-)
(BTW, shall I say : it is me or it is I ?)

Anyhow.
I have here some FET data sheets where they give as a noise parameter
the "Equivalent input noise voltage" in nV/sqrt(Hz).

I can't locate the paper where I had written the formula to convert this
parameter into more traditional NF in dB.

Can someone help me ? (If I remember, NF was also depending on the noise
current). By the way, it is given @ 100 Hz, so I suppose we are speaking
about flicker noise here. Is there any way to guess NF at, let's say,
50 MHz ?

THX,
Vincent

Dana Myers (myers@West.Sun.COM) wrote:

: >Hmmm... That's true of course. Well, I can also use a mixer made
: >by MiniCircuits. They work well, I think.

: That's what I would choose. I'd start out by designing the front
: end amplifier for a few more dB of gain than the mixer loss, and
: terminate the mixer in another common-gate FET with moderate
: gain, followed by the crystal roofing filter. This kind of
: arrangement works really well in the few radios I've seen use
: it.

Common gate at 50 MHz ?
I cannot use a XTAL filter, since I have only a 30 MHz XTAL that
transposes 50 to 20. But I think I am going to design some kind
of elliptic low-pass filter to filter out 30 and 80 MHz.

Thank you for the advice.

Vince

PS : Regarding FET noise, the BF 256 is given as NF=0.8 dB f < 100 MHz.
There is also the double-gate BF 998 with NF = 0.7 @ 200 MHz... and the
CAG capability !

I remember when CK722s were much more expensive around 1956. They gave
us a few in electronics lab at Texas A&M. Took us about 2 minutes to
blow them all to smithereens. The prof was extremely upset and we all
decided that transistors were a temporary fad and would never compete
with tubes.

My partner and I are using the Ramsey FR-146 2-Meter FM receiver kit to receive data broadcast at a frequency of 155.445 MHz. The data is sent with a 6 second delay between each new message. We are having trouble squelching out the noise during the 6 second delay period. The squelch seems to either cut out nothing or it cuts out everything including the data being broadcast. If anyone has any information regarding this kit or where we could receive help, we would appreciate hearing about it. Please e-mail any comments or suggestions.

Thanks.

Try the LM3909 IC - lets you blink an LED for years off of a 1.5 volt
battery. We used to use lots of these to put LEDs in cow skulls - why?
tt is a long story...

I like the 3909 (RS 276-1705) blinker because it runs on a single 1.5 Volt battery and goes for many years and uses only 4 parts. I think this is the chip used in the flashlights on the airlines that have a blinking LED. I read that this circuit seems to extend the shelf life of batteries???

LED
1.5 V battery
cap about 300 microfarad
3909 chip

Connect 3909 as follows:
Pin 1 to pin 8 & cap - lead
pin 2 to cap + lead
pin 3 no connection
pin 4 to battery -
pin 5 to battery +
pin 6 to LED cathode
pin 7 no connection
pin 8 to LED cathode and pin 1

Have Fun,
Brooke

>photon when you use alternative current.

>Vincent.

You also get photons when you accelerate electrons just normally... A simple chodic display is a formidable source of photons, but since the electrons had been coming in at a few to a few tens of kV, and are decelerated within a small fraction of a mm to rest by the phosphor in the screen, you don't get RF at all, you get X-RAYS. Nowadays, they try to keep the voltage low enough that those x-rays aren't particularly penetrating, and get absorbed by the glass and stuff in front, but older TV sets used to be something of ionizing radiation hazards, from just this effect. It's called "bremsstralung" (though it might be spelled somewhat differently) and is why paritcle accelerators need to be so long (when you give these electrons all this energy, they accelerate, emitting photons, giving most of the energy right back! - so you have to stretch it out.)

On a slightly more related topic to the thread of this newgroup, Free Electron Lasers work by wigging or "undulating" a beam of electrons back and forth by magnets, as they travel along, and presto!, photons come off. These can be anywhere in the EM spectrum, radio -> x-rays, and I *think* there are some high-power microwave tubes (klystrons? carcinotrons? magnetrons?) that operate by setting up a resonance between electrons that wiggle, giving off (microwave) photons, and using these photons right back to wiggle the electrons in just this correct way, so the thing's an oscillator.

But put me down as agreeing with Dave Curtis, "Accelerate an electron, get a photon."

Hi all,

I just posted this to sci.electronics, forgetting that this group is probably a much better source of the info I need...anyway, I need to make a coil of several hundred microhenries out of some pretty hefty wire...probably about 12 guage copper or so.

I recall there being an equation in my old ARRL handbook (which I have lost track of since I moved last) relating coil size, number of turns and I think wire guage. If you have this equation handy and wouldn't mind enlightening me I would really appreciate it!

thanks,
Pat KA2AYK

RCA also made a completly clear case CK722. A friend's dad worked for
RCA in Cherry Hill (then Delaware Township) and Camden, NJ. We had
moved from U-Control to RC model airplanes, and this transistor was
the basis of a kit which was one of the first solid-state RC units.
The problem was that the CK722 was hard to get, and my friend's dad
had to pull a few strings to lay hands on one in the spring of 1956.
I'm not sure how widely RCA distributed these things, but you could
see the chip and the fairly crude wire-bond attachments through the
clear plastic case. We marvelled for hours about the thing, even
though that stuff about holes was Greek to us.

Here's a suggestion, one that many others are using:
use a modified CB radio!

Buy an old 23-channel crystal-heterodyne CB set at a
flea market or yard sale, should cost less than $10.

Change one of the heterodyne oscillator crystals to
put the set on the desired 10m frequency.

Hard-wire the mic connections to lock the set in TX.

Keying the transmitter could be done by making and
breaking the final output transistor's emitter lead
connection to ground (they are usually tied directly
to ground). Your keying circuit will have to be
capable of handling about three amps current.

There have been a few articles over the last 15 to
20 years about converting CB radios to 1m CW. Look
in back issues of 73, Ham Radio, QST, etc.

Good luck!

Sure, common gate at 50MHz. I've seen common gate used down to
2MHz. I don't know of any reason why it wouldn't be used, and
it offers the advantage of a good termination for a filter without
increasing the NF of the stage, which adding a shunt resistor to
the input of a common source stage almost certainly would do.

>I cannot use a XTAL filter, since I have only a 30 MHz XTAL that

Coupled resonators is probably the filter of choice if the bandwidth
isn't too wide. Elliptic filters of narrow bandwidth can have
unrealistic component requirements...

1802. Help w/ 6 m reciever circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-19 00:00:00 UTC
From: midgard@nycmetro.com
Message-ID: <1177.6652T1019T668@nycmetro.com>
Source record: 106728

Howdy folks, on page 54 of the March 1996 issue of CQ magazine is a schematic for a 6 meter FM reciever. I've only got a basic knowledge of Electronics but the circuit seems pretty easy to do...plus the Parts don't appear too costly even if I DO screw up ;-)

Anyway in the article it says to make this circuit manually tuneable I should replace the Crystal with a "series resonant LC combination". Therein lies my problem. I HAVE NO CLUE what this series resonant LC is....Any help or better yet part # or circuit schematic would be MOST welcome. The only LC I recall is LCD as in Liquid Crystal Display....this series resonant LC isn';t a Liquid Crystal IS IT?
Thanx for the help folks.

Ok lemme push my luck......If someone could provide a circuit to Digitally tune this complete with a LCD readout I'd REALLY be appreciative.

Thanx for the help.

>it. Not that I would part with it anyway, but I could at least verify
>the physical appearance.

The CK722 came in BOTH colors. The genuine OFs (count me as one)
remember the earlier ones as being blue. BTW, the package consists of
two cases, a very small metal package containing the actual device
encapsulated in an epoxy-like substance, itself enclosed by the larger
blue or silver can.

I always preferred the GE point-contact 2N107 over the junction CK722,
because its highet Ft (almost 2 MHz, or should I say 2 MC !!) would
allow better BC band transmitters...

Lordy, how time do fly.

Source record: 106584

In addition to the guy who posted the WWW links, I would just like to add a couple of tips:

1. Keep your circuit changes to a minimum. For a CW rig on 10m or 12m, you want to start with an AM rig, remove the modulation transformer, put in a simple keying circuit and sidetone oscillator, and a BFO unless you know how to make a product detector work easily. Then open up the clarifier and make it into a transmit/receive fine tuner. For a 10m FM conversion (use a rig with the proper Cybernet board unless you have access to a Hy-Gain board) stick with a by-the-book conversion here too. For a SSB radio, get an old crystal controlled 10m SSB rig and just move the frequency band to 10m or 12m. Following a magazine article and keeping it simple is much better than blazing new trails, because so much of the planning details are already worked out for you.

Another idea for CW is to use a SSB radio because no receiver conversion is necessary. But then the tendency is to make a multi-mode transceiver (just so you can get more stuff in one box) and the more complicated you make a conversion, the easier it is to make a mistake and have it die on the table.

2. Don't neglect a major resource, possibly the biggest: the neighborhood illegal CBer. You know the guy. The one who loves to run 3000W and whom you've cussed for giving ham radio a bad name? That same guy down your street probably knows everything about how to put all kinds of radios on any given frequency, and where to buy all the crystals and supplies.

3. Use only plastic tools on those little ferrite cores. The metal jeweller's screwdrivers will tear them up, and fast.

Achieving reasonable stability in a 30 MHz variable L/C oscillator is
extremely difficult, if not impossible. As far as I know, not even
the commercial VFO's from the 50's and 60's did it that way. They
stopped at the 40M band and used harmonics to drive the companion
transmitter on 20-10M. Even at that, stability and accuracy suffered.

If you're really determined to cover all the HF bands, you'll be much
better off to build a VFO that covers something like 5-5.5 MHz, then
mix it with various heterodyne crystals to cover all the bands.

The formula for the inductance of a single-layer air-core coil is:

L (uH) = (a squared * n squared) / (9a + 10b)

where a = coil radius in inches
b = coil length in inches
n = number of turns

Conversely, the number of turns of a single-layer coil for a required
value of inductance can be found from:

n = sq root [(L * (9a + 10b)) / a squared]

According to the Handbook, this formula is a close approximation for
coils having a length equal to or greater than 0.8a.

What they are indicating is that you can replace the crystal (one freq) to a
tunable circuit that provides a variable frequency. The formula for figuring this
out is :
^3 The number on top is 10 to the 3rd.
____10__________
F=
2 PI (Square root of LC)

Sorry, thats the best I could do, Where F = Freq. in MHz, L is inductance in
microhenrys, C is capacitance in picofarads and PI of course is 3.1416.
The end result is simply a variable capacitor in series with an
inductor or a variable inductor with a fixed capacitor. F should equal
the frequency of the recommended crystal which is probably not 50Mhz.

Yes, there have been several articles detailing digital VFO's that
would plug right in to the circuit your describing, although, no
offense intended, if you don't know what an LC circuit is a digital VFO
may not be the project for you.

Best regards,

Tim KA8DDZ

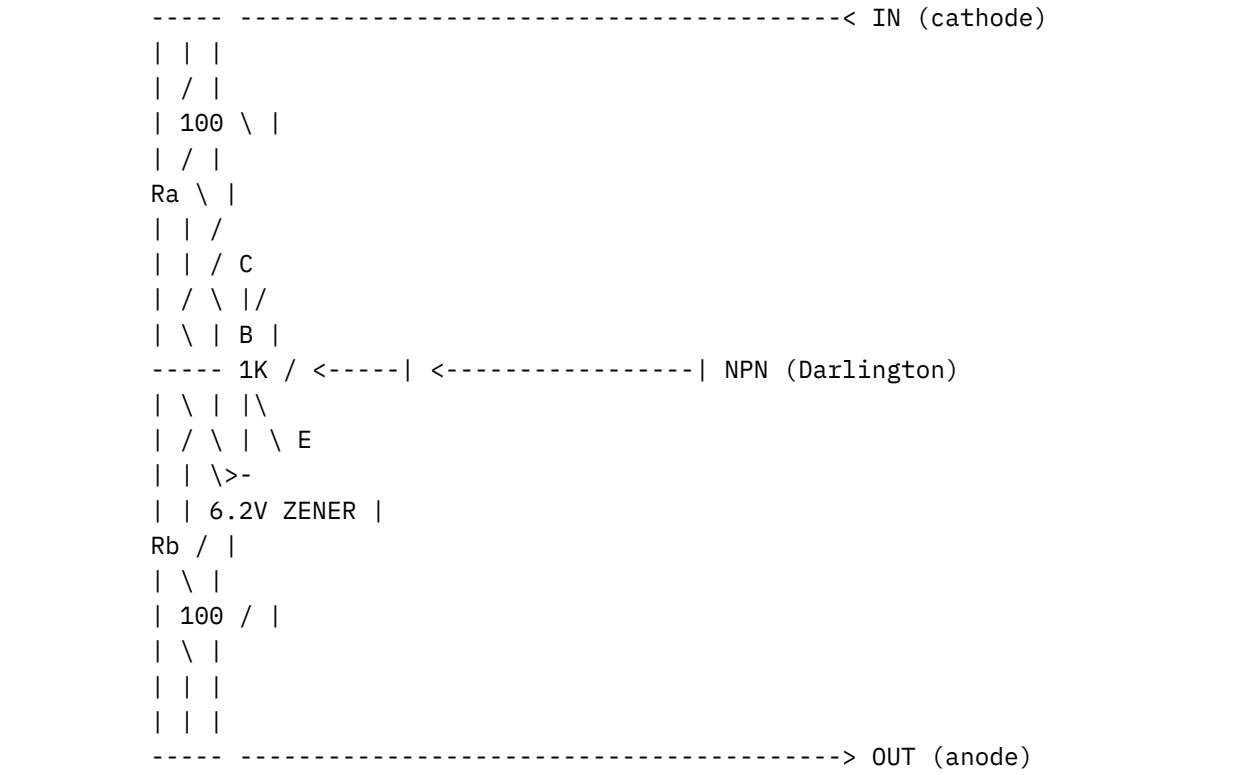
Yes. High power tetrode screens can source as well as sink current. A stiff screen supply is needed that can handle at least the rated screen current in the reverse direction. This can happen quite easily while tuning an amplifier and result in a fried tube so fast that you would think you were working with a transistor. Eimac used to print a booklet called something like "The Care and Feeding of Power-Grid Tubes" (or maybe it was Tetrodes instead of Tubes - my memory is also fading fast and my copy is thousands of miles away. Sigh...) There was a good discussion on what they called "negative screen current" that would be

worth reading if you could find a copy. I learned it the hard way while trying to design a little 250 watt HF amplifier with an RCA 8122 about 25 years ago. I (stupidly) put a diode in series with the screen supply, which naturally allowed any negative screen current from the tube to raise the screen voltage to the plate voltage range, and *bingo*, fried tube. Live and learn - Eimac taught me what school courses and RCA didn't.

About high-power zener diodes: there is a circuit called a "zener equivalent" which has been used in several HF amplifier designs by my former (and still time-to-time) employer. This circuit may have been patented, many of their "neat tricks" were. In that case, maybe I'm letting myself in for trouble I don't need, but here goes anyway:



Sorry for the crudeness of the ASCII "schematic". The "zener equivalent" is the circuit from "IN" (cathode of zener) to "OUT" (anode of zener.)

Imagine that you have set the pot to 360 ohms "down" from the high side. Then Ra=460 Ohms and Rb=740 Ohms. The voltage drop from the pot wiper to "OUT" must be (6.2+1.2=) 7.4 volts. Then the current through Rb must be (7.4/740=) 10 mA. Ignore the base current - it's a Darlington, after all. If the current in Rb is 10 mA, then the current in Ra+Rb is the same. So, the voltage drop across Ra+Rb is (1200*.010=) 12 volts and the whole circuit acts like a 12v zener diode, with a slightly weak knee. I used a circuit pretty much like this one in the cathode of my 2 meter 8877 EME amplifier, instead of the fixed 12 volt high-power zener specified in the design note. It worked well, no instability at all and plenty of idle bias control. Looking at this one, it appears that the "zener equivalent" could be set from about 8 to about 89 volts.

Flamers take note: this circuit was recommended to me by a fellow ham at my (former, sometimes, whatever) employer. I really don't recall if he said it was patented or not. Please keep in mind that an electronic circuit like this one can be patented - in spite of the obvious "copy-ability". In the 50s and 60s, the "big 3" (or maybe it should be "big 4" or "big 5") HF-SSB radio manufacturers routinely patented circuits like this one. They used to sue each other over patent infringements about as often as you (probably) change your socks, generally to no avail. Not the socks, the lawsuits ;-).

Hope this helps - next time I jump in here maybe I'll tell you about the 20 kW HF-SSB transmitter we built out of two 10 kW 2-30 MHz auto-tune amps and a *big*, autotune, combiner, for the Sheik-of-Whatever in the Persian Gulf (maybe it was Sheik Yerbooty, I don't recall) to play with... the loudest thing on 20 meters at the time ;-). The waster was a 10 kW Bird. I have to laugh at the "5 kW on 75 meters" and "5CX3000A" posts. Wimpy li'l thangs...

>50 MHz ?

The information below is from an excellent book on noise called
"Low-Noise Electronic Design" by C.D. Motchenbacher and F.C. Fitchen,
published by John Wiley & Sons, ISBN 0-471-61950-7. This book is 20
years old. I believe that there is a newer edition out with a slightly
different title.

NF = 10 log[(Eni^2) / (Et^2)]

= 10 log[(Et^2 + En^2 + (In^2 * Rs^2)) / (Et^2)]

where:
Eni = equivalent noise input
Et = rms thermal noise voltage of a resistance
En = rms equivalent noise voltage generator (the transistor)
In = rms equivalent noise current generator (the transistor)
Rs = resistance of signal source

Et = sqrt[4 * k * T * R * (delta freq)]

-or an approximation-

Et = 0.1268 * sqrt(Rs), in nV/sqrt(Hz) at room temperature.

From my experience, equivalent input noise of a JFET is pretty
constant from low frequency to high frequency (my experience only goes
up to 5 MHz), however, the input noise current starts to increase at
higher frequencies, usually around 100 kHz. The slope data I have
seen shows the input noise current increasing at approximately 20 dB
per decade of frequency.

: seen shows the input noise current increasing at approximately 20 dB
: per decade of frequency.

Well -
Looking at the BFR30/31 data sheet, the corner frequency seems to be
around 100 kHz. At that frequency, the En stops dropping and In begins
increasing.
En drops at about 3 dB per decade from 10 Hz to 100 kHz.
In increase at 10 dB per decade from 100 kHz to 1 MHz where the curve
stops.

Assuming that the corner frequency lies around 100 kHz, if Rs opt at
100 MHz is r, at 50 MHz, Rs opt should be 2r, no ? and NF(50) < NF(100).

How to account for the reactive component ?

Source record: 106595

Continuing my last message :

Elendir (elendir@enst.fr) wrote:
: How to account for the reactive component ?

I have taken the BF 981 (Dual-Gate MOSFET) in which are given noise circles
for 100 and 200 MHz.

Taking two samples of NF for real Rs at each frequency, it gives :

100 MHz : en = 1.18 nV in = 2.46 pA Rsopt = 479 O
200 MHz : en = 1.19 nV in = 3.64 pA Rsopt = 326 O

Okay, we see that at VHF range, en is stable while it is in which varies.

Assuming a law : in = a * F ^ b, we find :
a = 0.18 and b = 0.57, where a is in pA and F in MHz.

Therefore we interpolate :

50 MHz : en = 1.18 nV in = 1.67 pA Rsopt = 705 O NFopt = 0.9 dB

However, both value do not take in account the reactive Bs component which
seems to be quite large.

And, moreover, at 100 MHz and Ysopt = 0.5 - 1.2 i mS, NF = 0.6 dB !!!
And, at 200 MHz, Ysopt = 0.5 - 2.56 i mS, NF = 0.7 dB.

We see that the Gs has not changed, whereas the Bs did !

Therefore, how to guess that reactive component which we cannot obviously
ignore !

Vincent

Wow, you are trying to do the next-to-impossible on your _first_ major homebrew transmitter project?? Well, you probably shouldn't try it, but if you are set on doing that, here's a possible route:

Build a VFO that uses diodes (PIN diodes if you can get ones with long enough lifetimes for HF use) to switch among a rather large number of fairly narrow frequency ranges. You can tune within each band with your choice of part: mechanical capacitor, mechanical inductor, or varicap diode(s). But whatever you use, include a varicap which can tune it over a narrow range, perhaps 50kHz, and use either frequency or phase locking driving that varicap to keep the frequency stable. See the HP8640B signal generator for a way to do phase locking to the frequency you tuned manually; it basically counts the frequency before you select "lock", then uses that count to run the phase locking loop. Frequency locking is even easier, since you only need to count the LS bits to be able to track slow drifts. For either phase or freq locking, you could build a switch into the tuning knob so it would lock except when you pushed it in to tune, for example--maybe even put a brake on it so when it's released, it stays put, though that's probably overkill.

But you are probably better off to constrain the problem, and build a VFO that covers about half a MHz, hetrodyning to get to the desired band.

Gang -
Well, I have been working for about 6 months on a Blue Earth Computer contoller connected to an AD7008 DDS as a vfo for a QRP transmitter/recvr. I have had some success as the transmitter works. I have NO MORE time for designing the receiver or creating an integrated unit. ;'(:'(. I am going to try and sell the items to someone who would continue to make a workable system or would like to experiment with DDS vfo's. So here is my list:

AD7008 Prototyping Board from Analog Devices. Single +5 supply,32 bit phase accumulator, on chip 10 bit DAC, sine - cosine look up tables, 50 mhz speed. Board originally was $295 when I bought it.

AD607 Single chip receivers - 3 ea. These items are VERY RARE!!! Used with the AD7008 for full AM,FM,CW, BPFSK,FSK receiver.

*** Blue Earth 80C51 Prototype Board controller*** Comes with display, 16 & 4 keypad, 12 I/O lines for controlling devices, Tiny basic built in interpretter, Com port cable. Cost over $250 new.

All of this can be used for making your own DDS vfo, tranceiver, frequency synthesizer, etc. I am looking for a Sierra Kit with modules in trade, OHR 4 Bander +, money, other kits, offers (virgins, trips to Mars, Cryo storage facility for internment) :') .

I am going away for two weeks, so please E-MAIL to:
mcclun@clark.net and not the server listed here.

Pat:

Wheeler's equation for a single layer coil is:

uH=(r*r*N*N)/(9*r+10*L)

uH = microhenrys
r= radius in inches
N= # of turns
L= length in inches

You can do some computer simulation based on the idea that the resistance
of the coil varies directly as the length of wire used and find that
r=1.23*L [L=r/1.23]. Also you get the highest Q if the spacing between
turns is about the same as the wire diameter.

Good luck,
Brooke

1826. Various transmitter-design questions

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-20 00:00:00 UTC
From: Isaac Kohn <ikohn@vertex.ucls.uchicago.edu>
Message-ID: <31505E54.513F@vertex.ucls.uchicago.edu>
Source record: 106604

A few more questions here. Seeing as a multi-octave VFO is impractical, I'm designing a super-het transmitter. I want to cover most-all of the HF range. The way I'm currently thinking about doing it is:

Fixed 1000Khz osc mixed with AF. Obviously, AF=amplified microphone and osc would be buffered. This way I can have a switch that selects either a 1Mhz LP filter (passive OK?) or a 1Mhz HP filter for SSB. I'd like to make this first mixer passive, because I can get adequate levels of OSC and AF injection and I want to save the complication of an active mixer. This would be followed by a 1Mhz-tuned amp, and another mixer that mixes a different osc. freq. for each band. This second mixer would have to be active, because I want to have relatively pure output from that.

The advantage to this design is that the filters for SSB are at a specific frequency no matter what band I'm on, and I can cover any frequencies I want provided I can build a (crystal) oscillator for that band. MY PROBLEM IS: Another advantage to this design would be if all of my gain were in the 1Mhz section, so I wouldn't have to retune the amplifier for each band. SO THE QUESTION IS: CAN I BUILD/BUY A MIXER THAT CAN HANDLE 30-40dBm OF INPUT?? This sounds ridiculous but I don't want to have different tank circuits in an amplifier for each band of operation (I don't think I can gang-tune it with the second oscillator, because I want them physically separated). Someone please help me!!

Another necessity of this idea is that I'd need to be able to tune the second oscillator through the entire band, which (I think) rules out crystal-controlled oscillators. This brings me back to the need for a multi-band VFO. I suppose a possible solution is for the second oscillator frequency to be generated by mixing a 500-Khz tunable VFO with a crystal-generated freq. and mix the result with the 1Mhz IF... This gets to be a lot of mixing, a lot of unwanted frequencies that I'm not going to build a filter for....

I HOPE SOMEONE READS THIS LONG MESSAGE. PLEASE HELP ME!!!

Any thoughts appreciated. In fact, if you even took the time to read this I appreciate it!

Hamtronics used to sell a 1 watt exciter (FM) for 10 meters. By
leaving out the modulation, you could key it as a CW transmitter.
I haven't seen their ads lately, but it may still be available.

But you really don't need that. You can easily build a crystal
controlled 10m QRP CW transmitter from scratch. See the RSGB
Handbook, or one of the QRP books, for suitable designs.

>photon when you use alternative current.

Is that like alternative energy? (Sorry couldn't resist.)

You most certainly do get radiation when you accelerate a charge,
even in a CRT. The amount and frequency of the radiation depend
on several other factors, however. One major factor is current,
and beam current in ordinary CRTs is tiny. Another factor is the
amount of acceleration. In a CRT there are four separate accelerations,
beam accleration, beam decleration, and horizontal and vertical beam
deflection. Of these, beam deceleration is the most intense, and
generates soft X-rays. Beam acceleration is second most intense,
and generates millimeter wave radiation. Deflection is least intense,
but more gross, and generates radiation at the frequencies which
are reciprocals of the deflection timing, IE for ordinary NTSC TV
CRTs that's 15.749 kHz and 59.94 Hz. Very little of the latter
propagate out of the tube due to the small coupling area with
respect to a wavelength (most of the interference generated at
these frequencies comes from the H fields of the magnetic deflection
coils outside the envelope (amperes of current flow in these coils),
and not from the beam itself).

The W1FB Notebook has some nice and very simple VFO designs for HF use,
It would be a great starting point.

: internally down to 10m? I have a couple of rat shack 11m good for
: nothing cb's laying around and need a use for them. Thanx in advance.

There were lots of articles int 73 Magazine in the early 80's
on converting different CB rigs to 10 meters. Basicly they all
involve studying the block diagram of the rig, changing one
or more of the crystals, and perhaps re-tuning some of the
tuned circuits.

Start by buying the service manual for the particular CB you have
to get the detailed theory of operation of the synthesizer involved.

Well worth the $89($100 for me with shipping). I like the 'c like'
language. The setup code is
complex, but well documented code is included. Figuring out what
register moves are legal seems harder than with TI's 320c26, but there is
a lot more memory and it is all equally accessible, and it runs 3 times
faster.
Kit comes with power supply, and I think there was a serial cable. I
didn't expect either for that price.
If you will be driving hardware with the analog output, you will need
to disable it or make it harmless during power-up. The kit emits a nice
message intended for speakers at power up.
The board is probably twice the size of TI's 320c26 kit if that is
important.
I wish the A/D-D/A was faster. Using mono, you can get 88khz which
makes ragged sine waves above 10 khz and the processor is barely working
at that rate.
The documentation is missing a good language reference. I have an old
ADSP-2101-2102 user's manual and it was necessary for me to spend a lot
of time reading it to understand the language and hardware.
Hope this helps,
Eric

73 Magazine (I think) did an article on a digital VFO a few months ago
(I can't find it right now). It used the Analog Devices AD7008 CMOS DDS
Modulator. It covered the complete HF band. Go to AD's Web site and get
a copy of the data sheet.

In the article, the author was selling a kit to build the VFO.

Sorry I can't find the magazine.

This appears to be a very nice implementation using Nagoaka's
accurate method to calculate solenoidal inductance, which saved
me from posting notes regarding Nagoaka. Since I use a real
operating system, I was delighted to find the source code and
a makefile was included for Unix, and I had no trouble building
the binary on Solaris x86 2.5 with gcc.

Here's some more info.

Software included:
A windows based demonstration program.
DOS Based Assembler
DOS Based Linker
DOS Based Promspliter
DOS Based Simulator. This is nice because there is no debugger. You
can do a lot with this simulator, including creating
plots of your output.
Demo programs

If you are serious about programming the 2181 (thats the chip on the
board) you will the "ADSP-2100 Family User's Manual", which is free from
ADI. An additional helpful book is "ADSP-2100 Family Assembler Tool &
Simulator Manual" also free from ADI.

I agree with the previous post that said the assembly language is easier
than the TI TMS32Cxx.

The set up for the serial port and the 1847 Stereo CODEC is a bit complex
but there are several demo programs that can be boiler plated.

ADI has a web page: http://www.analog.com with information (search on
EZKIT LITE). There are several samples of FFT, FIR, IIR and others.

Good luck,

Henry

Viny:

I get the impression that you may have some for higher frequencies. If so, they will be usable at lower frequencies with increased coupling factors. (A 20 dB coupler might now be a 32 dB coupler, or something like that) The directivity will suffer, but for power sampling with reasonable loads, they will be functional.

Message-ID: <31519E8B.6373@lanl.gov>
Source record: 106630

How so totally wrong? Even if the oscillator runs at 50 MHZ, which I doubt, it is POSSIBLE, albeit difficult, to get usable stability with an LC VFO for a rig operating at 50 MHZ. After all, I've used homebrew VFO's in old Motorola rockbound rigs for 2 meter FM, so it should be even easier for a 50 MHZ transceiver. Now, if he's hoping to tune SSB with a VFO, then I'd certainly agree not to waste the effort. But AM and FM should be possible.
This particular circuit sounds like it may use an NE602 osc/mixer circuit for a single conversion receiver, which means the VFO (Variable Frequency Oscillator, of course) to replace the crystal would indeed be running very close to 50 mhz. In this case the VFO should be operated at, say, 8 or 9 MHZ +- and multiplied and filtered to the desired injection frequency. If it's a dual conversion receiver he could use a VFO for one of the lower frequency conversion oscillators with better stability.

>HF range. The way I'm currently thinking about doing it is:

Why such a complicated approach to this project? For ham coverage only look at a Swan 350 Schematic and improvise. For a general coverage application read the circuit descriptions in the owners manual of a Yaesu 747 or similar. Wide band is easier than you think, and you need not re-invent the wheel. 73 and good luck. KD3SH

Jim, WB5AOX, says a free running L-C oscillator on 50 mc. might not be "totally wrong", as I so dogmatically put it.

Of course you're right, Jim. I meant it in the context of what seemed to be a first project for a new and inexperienced - but for that so much the more welcome - experimenter.

The ARRL Handbook has clear and easy - and properly tested - projects for the new experimenter.

Source record: 106641

G'morning all,

Is it possible at all to make a filter (presumably using crystals) that cuts off sharply enough (at 1000Khz) to pass one sideband, but not the other?? In other words, is it practical to assume I can find/build a HP and a LP filter for USB and LSB at an IF of 1 Mhz??

If this isn't practical, I have another potential plan that ought to be inexpensive and relatively effective, IF it works. That is, could I have a quadrupler (or higher multiplication) at AF level, then mix with 4 Mhz, then filter for sidebands -- 4 times less sharpness needed -- and then divide by 4?? Or would AF multiplier distort voice too much??

Thanks to all for helping, and 73's,
Isaac K.

1864. 10m Repeater Switzerland HELP wanted

Source record: 106642

Hello thank you for reading this message:
We, a small group of ham operators, will build a 10m repeater.
Both RX and TX are located up at about 2000 meters in the swiss
mountains.
A 10 watt beacon is ready to put up to the tx location. We are only
waiting for warmer weather conditions. It will operate on 29.660 mc.
What we are looking for:
Are there 10 m repeaters at such high locations in the united states
or else where ?
We are interested in what kind of antennas where used.
Also the lightning protection is a big problem.
Which kind of tx and rx constructions are the best for 10m
repeaters.
Any other tips are real welcome.
Thanks a lot.

You didn't say whether the antenna (dipole?) will be resonant, whether the antenna impedance will match the feedline, or whether you want the ability to tune both coaxial and balanced lines.

Assuming a worst-case scenario, the cheapest single-band tuner would probably consist of one coil, one capacitor, and two clip leads.

The coil would be B&W Miniductor stock. The winding would be cut in two places near the middle, forming a smaller coil that's electrically isolated from the rest of the winding. This center section would be the tuner's link input and you would feed the transmitter output to that winding. The ends of the wires that were cut in order to isolate the link would be connected to each other at the center so that the two outer sections form a single coil (the secondary).

Output from the tuner would be taken from the secondary. By using two clipleads, you can "tap down" on the secondary to achieve a match. The capacitor would be connected across the entire secondary, regardless of the position of the clipleads. If for some reason you can't achieve a match, the capacitor would be moved so that it's in series with the secondary instead of parallel.

I haven't tried it, but for ladder line or open wire, better balance might be achieved in the series configuration if the center connection of the secondary was broken and the capacitor inserted at that point, rather than between one outer lead of the coil and the feedline. Anyway, once you've found the tap position and capacitor configuration that works for a particular antenna, you shouldn't have to do anything but tune the capacitor from then on.

Link coupled tuners are popular for QRP work because of their high efficiency with balanced line. They're also easy to build at these power levels. To use this tuner with coax, just ground one of the output connections.

Following are the component values involved for 40 meters:

Link inductance:
1.4 uH (not critical, 1.2 to 1.7 uH will work)
Secondary inductance:

16 uH (also not critical)
Capacitor:
50 pf (only needs to be large enough to resonate with the
secondary at about 80% of the frequency of operation,
or in this case, 5.6 MHz). Standard receiver spacing
should be adequate to 100 watts or so.

As a final note, you might consider building a multi-band tuner of this type if you're planning on eventually using other bands. To do that, you would need a larger coil (to cover 80 meters), one more capacitor and maybe a band switch. Fair radio sells a used 9-position, 3-deck ceramic switch in their catalog for $3.00 that looks perfect for this. If you want to get fancy in the multi-band design, you can also add a variable capacitor in series with the link. That will give you a greater matching range for a given setting of the coil taps, which makes the tuner more convenient to use (why install a bandswitch if you still have to change taps)? Note that use of a series link capacitor requires that the link be approximately twice as large as without the capacitor.

I don't have current pricing on B&W coil stock, but I suspect a single-band tuner like this could be built for less than $20.00 in cost of parts. The multiband version would probably only add another $10 or $15.

Let me know if you need additional info.

>fairly narrow frequency ranges.

I have attempted to use pin diodes to switch to various sections of the same band (40M) so that I could use a varactor diode to tune over a more narrow range.

I found the amount of current through the pin diode had a *great* effect on the frequency of the VFO. I tried a few approaches and came to the conclusion that the pin diode approach was going to have a major affect on the stability of my VFO.

Having said that, the pin diode switching does work quite well in a Phase locked VCO, since the loop tracks out the instability caused pin diode.

There are two problems with this. First, it's unlikely you could build the filters you're describing so that you would have sufficient unwanted sideband rejection. Second, the filters would need to be BP, not HP/LP. Otherwise, even if the audio is cutoff at 3 KHz somewhere, you risk higher-frequency audio distortion products created in subsequent audio stages being carried through the transmitter. The filtering you need could be accomplished with 1 MHz crystal filters, but that's not a common frequency. In addition, if crystal filtering is used, it's less expensive to change the oscillator frequency between USB and LSB rather than use two filters.

>I'd like to make this first mixer passive, because I can get adequate

>them physically separated).

Mixers work on the principle of non-linearity. The output of an active mixer won't be any cleaner than a diode mixer in terms of unwanted mix products. Like it or not, you'll have to filter this transmitter at both the output of the mixer and the output of the final amplifier.

>
>This gets to be a lot of mixing, a lot of unwanted frequencies that
>I'm not going to build a filter for....

This transmitter won't be usable the way you're describing it. You
MUST filter out the unwanted products.

You didn't say whether this would be tube or solid-state, but my
advice is to look through as many different years of the ARRL Handbook
as you can get your hands on. Even some of the CW-only transmitters
have used heterodyne schemes adaptable to SSB. This will give you a
better idea of the frequencies involved and the degree of filtering
necessary to produce an acceptable output signal.

I MHz isn't a particularly good intermediate frequency for a number of
reasons. There are two "classic" IFs for SSB radios, 455 kHz and 9 MHz.
Among other advantages, you can easily get filters and IF transformers
for these IFs. A third alternative would be a very low IF like 60 kHz,
the advantage here is that it is feasible to make a pure LC sideband
filter at this frequency. You're going to need either a crystal or
mechanical filter for higher frequencies. The Collins mechanical filter
is very popular for 455 kHz IFs, and crystal filters are standard at
9 MHz.

9 MHz is a very convienent IF for an amateur rig because you can get
two amateur bands by directly mixing a 5.0-5.5 MHz VFO with the output
of the IF modulator. The sum frequency puts you on 20 meters, and the
difference frequency puts you on 80 meters. For the other bands, you'll
need to pre-mix the 5.0-5.5 MHz VFO with a crystal oscillator to get
you the proper offset. For example, you could mix with a 7 MHz oscillator
to cover 15 meters, IE 5.0+7.0+9.0=21.0 MHz.

For a general coverage design, however, 9 MHz isn't such a good choice
because it falls inside the desired tuning range. 455 kHz can be a better
choice here, but there's another fly in the ointment. At the upper end
of HF, the image frequency from the mixer will be close enough to the
desired frequency that you may have problems achieving sufficient spectral
purity. So you may have to resort to a double conversion design. The
modern method is to choose an IF well above HF, say 70 MHz, and downconvert
to the desired HF frequency. Using a frequency synthesizer covering the
range 40 MHz to 69.5 MHz, you can cover all of HF in one "band". If you're
limited to using a LC VFO, however, you're still best using the 5.0-5.5 MHz

VFO and premixing it with a gang of crystals to achieve the 40-69.5 MHz range in a number of switched bands. 70 MHz is another of those convienent IFs, because filters and transformers are available for it.

>The advantage to this design is that the filters for SSB are at a
>specific frequency no matter what band I'm on, and I can cover any

>A MIXER THAT CAN HANDLE 30-40dBm OF INPUT?? This sounds ridiculous but
>I don't want to have different tank circuits in an amplifier for each
>band of operation (I don't think I can gang-tune it with the second
>oscillator, because I want them physically separated). Someone please
>help me!!

Well, yes, you could have a mixer that would handle that power level, with vacuum tubes. It was done with 829Bs many years ago. That's not really a good plan, however. One of the reasons that it is a bad plan is that you *also* need a high power oscillator signal, so there's another set of tuned amplifiers to consider, and they won't be at a fixed frequency. And the other reason is that the high power mixer will have an output rich in harmonics, and will be a challenge to filter.

The modern way is to use a broad band output amplifier. This is easy with solid state. And follow the amplifier with a series of switched low pass filters (one for each decade) for harmonic suppression. Nothing has to be gang tuned with this method.

>Another necessity of this idea is that I'd need to be able to tune the
>second oscillator through the entire band, which (I think) rules out
>crystal-controlled oscillators. This brings me back to the need for a
>multi-band VFO. I suppose a possible solution is for the second
>oscillator frequency to be generated by mixing a 500-Khz tunable VFO
>with a crystal-generated freq. and mix the result with the 1Mhz IF...
>This gets to be a lot of mixing, a lot of unwanted frequencies that I'm
>not going to build a filter for....

Well that's the way it works. If you choose your IF carefully, and your pre-mix scheme carefully, you can avoid having products fall inside the band you're currently tuning. If you choose unwisely, you *will* have products falling in the current band. In a receiver these would be called birdies, and they're very annoying. In a transmitter they are called spurious outputs, and they're more than annoying, they're illegal. So lots of filters are required.

I think you might want to gain a bit more experience before tackling this ambitious a project. I suggest that you build a single band SSB transmitter first. 20 meters is a good choice. Use a 9 MHz IF and a 5.0-5.5 MHz VFO. This is very conventional, very classic, and won't cause you lots of grief. There are even kits available if you decide not to build it completely from scratch. Adding 80 meters later will

be a snap, just change the filter after the mixer, and change the output tuned circuits in the PA (these can be switched). Then you can get into pre-mix schemes to add the other bands one at a time.

Spectrum International sells the sideband filter and matching upper and lower sideband crystals. Use a simple packaged Mini-Circuits DBM for the DSB generator, and another one as your conversion mixer. If you don't mind big, the tuning capacitor from an ARC-5 will be perfect for the VFO. It covers the desired range, has a wonderful gear reduction drive with anti-backlash springs, and is made of Iconel for almost no temperature drift. You can still find these things, or at least the capacitor, at many hamfests. If you must have small, you can use a varactor diode to tune the VFO, through a multiturn pot. This is the way modern QRP rigs do it, but tuning won't be as nice, or as stable.

If you still want to scratch build, I suggest you build the transmitter as a series of separate modules. Build the VFO first. Get it working right and stable. Then build the AF amplifier module. Then build the sideband oscillator, DSB generator, and sideband filter as another module. Then build the conversion mixer and 20 meter post-mixer filter. Now you'll have a low power transmitter. Now build your PA and output filter. You should have a complete working 20 meter SSB transmitter at this point.

> I want a new tubes and I think that I doubler the voltagem = 2800 V
>and 0.5 ampers I can use a one 3 - 500 z tubes.
> I ask by any especialist what do you think about my decision ?

You'll have to redesign the output network. The sweep tubes wanted a load line of approximately 1300 ohms that had to be transformed from 50 ohms by the output network. The 3-500Z will want a loadline of approximately 5600 ohms at the voltage and current you propose, so the existing output network won't provide the transformation.

But if you're ready to redesign the output network, this will make a better amp than what you have now. Don't forget to improve the cooling system while you're redoing the RF deck. You're going to have to move a good bit of air to make the tube seals live.

I'm sure Tom will have some further suggestions.

Gary

>Mhz??

Well, that's not the way it is done. You use a crystal filter that
is only wide enough to pass one sideband. Then you use two carrier
oscillator crystals offset so that using one will place the lower
sideband in the filter's passband, and the other will place the
upper sideband in the filter's passband. So by switching carrier
oscillator crystals you choose which sideband you want to use.

> If this isn't practical, I have another potential plan that
>ought to be inexpensive and relatively effective, IF it works. That is,
>could I have a quadrupler (or higher multiplication) at AF level, then
>mix with 4 Mhz, then filter for sidebands -- 4 times less sharpness

>too much??

That won't work. The multiplication and division will completely
distort the signal so that it will be unintelligible.

1875. Re: CB to 10m Conversion

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-22 00:00:00 UTC
From: Bill Nadzam <nadzam@garlic.com>
Message-ID: <3152EF57.7FB1@garlic.com>
Source record: 106653

I can help you with this, but you'll need to choose a radio. There
are many CB's that will work well as 10 Meter radios, but each has
it's own conversion technique. So what is the radio? Keep in mind
that the most modern designs can not be modified. That was done
so that the CB crowd would not jump over their 40 channel limits.
the older designs could be modified very easy, and allow you to get
up on the 10 meter band. Some of those radios are still sold today.
One is the Cobra 148GTL and the Uniden Grant XL.

It will effect a VCXO the same way. My transceiver uses the CW
receive crystal in transmit by switching in a small variable cap to
produce transmit offset. A switching diode "connects" the cap into
the circuit.

In one configuration of the mode switch, two 1N914 diodes were in
series with the switching diode and 9.8 volts was applied. In another
position, only one 1N914 was in series and 10.5 volts was applied.
That slight difference in current through the switching diode in the
xtal oscillator (9 MHz) resulted in a frequency shift of about 75-100
Hz.

Markus Buehler <mbuehler@hitline.ch> writes:

>Are there 10 m repeaters at such high locations in the united states

There are a few here, a couple in Carribean area. Think at least some
must be at the 2000m mark. Good coverage? Yes when local propogation
and half way around world when band opens.

>We are interested in what kind of antennas where used.

Wind and static charge would both be enemies at exposed altitude. Something
that is a DC ground type such as Cushcraft Ringo is one way of doing it.
1/4 wave is more of a sky warmer as opposed to the 1/2 wave Ringo type. More
radiation is sent upward with the 1/4 into space rather than toward
horizon as compared with 1/2 wave.

>Also the lightning protection is a big problem.

Lightning arrestors. Polyphase here in US is one company with products that
should take care of problem (not a plug for Polyphase).

>Which kind of tx and rx constructions are the best for 10m

Whatever is laying around for used 29-30 Mhz FM gear. A lot of conversions
have been done with the 30Mhz "Business Band" FM mobile equipment in
Ham radio mags.

>Any other tips are real welcome.

Think real hard about how much power on the tx. If you HAVE to put tx/rx
together at same site, expect to battle the rx desense problem. Filters/
or antenna duplexers are huge and costly due to size because of low
frequency. Thats why the migration to the 2m and 70cm where these
aren't necessary if there is enough vertical space between rx
and tx on a tower. Even about 30 ft. is enough at these frequencies.

>Any other tips are real welcome.

Consider using 10m input and 70cm out for the system? A 2000m site whould
give decent range for the 70cm output, and there wouldn't be the
long range users when band opens up again. Unless you like the company
then go for it and make in and out 10m.

>A 10 watt beacon is ready to put up to the tx location. We are only

Whats the call sign???

Hi

I'm a second year electronic student and need a project for one of
my subjects.

It must be something that I can build, (a pcboard), thus easy enough
to understand the operation of the circuit. (more or less). I've been
looking for a nice FM radio receiver (TDA7000 ?) to build but couldn't
find anything practical. I'm interested in radio communications. Any
FM receiver, practical to build will be nice.

I'm still very new on the Internet (first month) so can anybody help
me finding or searching projects on the Internet?

Thanks...
Stephen.

Hi Shelby,

By manipulating the loop oscillator crystal frequency of your CB set,
you can move the 40 channel (400Khz aprox.) segment to ant part of
10 meters. It's best to start with a SSB radio for CW but you can
use an AM setif you want to go up to 29 Mhz (AM window).

If you want to "E"mail me on specific modification of your particular
rig, you need to tell me:

1. The chip number of your PLL.
2. What frequency you want to go to.

Depends. What are you trying to match - like from what
to what? Output pi-net to coax? interstage coupling?
Your tuner too sharp? Eg, your question is a bit too
general. Look in texts under "swamping" and "Q-factor"

It's actually far more practical these days to make a phase-
shift type SSB generator than to try and make (UGH!) or buy crystal
filters. With only six poles and using 1% resistors and 2% capacitors
(readily available), you can make a very inexpensive SSB generator that
will have 40dB of unwanted sideband suppression with a baseband of
50-2500 Hz. It requires the phase shifter, two mixers, and a combiner.
By changing the polarity of one of the two phase shifted channels, you
can select either USB or LSB. Total cost would be around $20.

I know that the question was about generating SSB signals with
a crystal filter, but I thought that this would be helpful as alter-
natives were also presented.

There is a third method, referred to as the Weaver modulator,
but I have found it to be less practical than the phase-shift approach.

>>I was tring to use autopatch but my I was not successful.

If you have trouble getting the touch-tones on the HTX-202 2-meter Ham Radio Transceiver (Cat No. 19-1120) to work with the local Repeater, try resetting the unit's touch-tone audio level.

To do this, you can adjust the touchtone pot (RV 1001) down until the tones don't decode, then up again until it JUST works. (Simply tuning down is NOT as reliable as this metho You uld make NO other adjustments!

Also, many repeaters will read back the tones once they decode properly. If you are unsure how to do this, you can find out from another repeater member.

This is all R.S. would have to say about there HTx-202. If you have had any problems with using the phone patch, this should cure it. Some have been setting the << Auto Reply >> function in the main setup to << ON >> to cure this problem. If you have, set it back to << OFF >> before adjusting (RV 1001) pot.

I have been tinkering around with the idea of making my own pager. Not your typical pager, but one that would simply transmit 1 to 2 miles. I plan on connecting it to my car alarm, such that when the alarm goes off it will page. The alarm itself already has a spare 12V lead that is meant for accessories, or other add on (pagers, door locks etc.) It sends 12V through the wire when the larm goes off. Can anyone point me in the right direction in the way of building such a device?

Thanks

Please e-mail me iff possible.

>e-mail swlease@ucdavis.edu

The HTX-202 has 3 deviation adjustments:

RV1 Microphone
RV1001 DTMF
RV1002 CTCSS

You will need to locate RV1001 for your adjustment. For best results
you should have a deviation meter or some other way to measure the deviation
as you make the adjustment and adjust for 3.5-4Khz of deviation. You
may be able to obtain acceptable results by the tweaking method though.

I seem to remember a different problem with the HTX-202 that caused
problems with some autopatches. It's been a while since I owned one
and this is from memory since I no longer have the operation manual.
But what I remember is a setup option that would keep the transmitter
keyed for a period of time after pressing one of the DTMF keys. This
time delay was too long for some autopatches. Turning this option off
may take care of your problem. It's worth a try and much easier than
opening up the radio.

>cheap, etc.

Greetings. I guess the grades of breakers vary because the ones I measured were sub 1 ohm loss. That's a lot less than 1.5V drop. I'm sure someone here will clarify this.

>My plan is to fuse both + and - on the batteries as close to terminals as
>possible, use fairly high value fuses to protect against shorts, say 10
>or 20 amps. They can't be changed in flight, but if one blows, I can
>switch to the other battery.

You can also try the fusible link... as used on cars. Looks like a piece of wire but is designed to blow at xxx amps. Might be easier to deal with than fuses (considering that when it DOES blow, the plane is going to need a good looking over anyways... ie. not something you're supposed to EVER replace).

>The next question is what to do about individual instruments. Nothing? or
>fuse each one? or put Raychem PolySwitches on each one? They're listed in
>Digi-Key, are cheap and have minimal resistance.

But they take a lot longer to "open" than fuses. Also, they work best on severe shorts.. if it's something that's ALMOST a short, they might take them up to a second (maybe more, I forget) to open. They also depend on outside temperature.

I would use a breaker. I really like the idea of being able to reset it under load and hope that just MAYBE it blew because the planets were aligned just such and it's not really a short [smirk]

Take care.

>We are interested in what kind of antennas where used.
I would consider a 5/8 wave verticals (these are popular for CB radio
in the states) And for static and near lightning hits have DC
continuity to ground
>Also the lightning protection is a big problem
all repeaters have this problem, Put in many ground rods straped
together with copper strips, (required length X 2" X..05") works.
polyphasor selles a lightning arestor that when tied to this grounding
system will help considerabily, if you are using AC power from the
grid make sure that you have surge protection
>Which kind of tx and rx constructions are the best for 10m
>repeaters.
I would buy a General Electric Exeuctive mobile . they are here in the
states tuned in the low 30 mhz regon and are a steal for $50-$100
>Any other tips are real welcome.
I would assume that running a split sight would be the easiest placing
the transmitter 1 mile from the receiver

i beleve that 10 meter repeaters run on a 100khz split this would be
difficult to do with a duplexer or cavitys. and would be bigger than a
car
if you run 2 antennas with one wave length vertical seperation
And build 2 2-3 section helical filters, one for the transmitter to
keep the transmitter noise from geting into the receiver, and one for
the receiver to stop the transmitter from overloading the front end of
the receiver might be a posibility that would work
>Thanks a lot.

>

Ok guys and gals, I will come clean !

I am trying to match an acoustic transducer which has a nearly constant resistive value of 50 ohms, but which has a capacitive reactive component decreasing linearly from 1000 to 600 ohms, over a frequency range from 150 KHz to 180 KHz. I would like to conjugate 'match out' that reactive component, or at least minimize it. This may not seem like a ham problem, but really impedance matching is a pretty general concept (at least to dopy me...).

A simple loading coil won't buy me much, the variance in the reactance is my major headache. I know the answer is a ladder network, but calculation of the ladder values requires an analytical look at things and I am...let me say... referencelessness.

Sorry for using the extra bandwidth in this repost. Thanks for the queries thus far too !

Take care...
Fabe

Solid State Design for the Radio Amateur, p. 167, Fig. 60. Delete the 75 pF fixed capacitor. Reducing the inductance by a factor of two and increasing the variable caps about the same amount will reduce the loss, although it's not bad on 40 m. (I use this design with additional inductors switched in parallel with L1 for use up to 15 m.) Adding a 33k or so resistor from the wire connecting the switch sections to the top of the 27 ohm resistor will give you a meter deflection when in the OP position, so you have an indication of tx output.

I've used this circuit for many years.

About a year ago I rescued the items listed below from some lady's front yard where she was preparing them (with regrets) to be tossed. I gather that they belonged to a now-gone husband or son. Condition of the items is unknown, though I can say that I see no obvious defects except the amp is missing a tube. I haven't even powered them up and don't intend to. If you want one piece I wish you'd take all three, but please don't snag all three if you'll really only use one. Pickup near MIT, Cambridge:

- Knight KG686 RF generator
- Knight KG688 Sine/Square wave generator
- Heathkit W4B amplifier (audio?)

Regards,

Michael O'Donnell mod@std.com

Note: I posted essentially this same offer about a year ago, got quite a few eager replies and I was looking forward to the satisfaction which I assumed would come from giving the gear to a good home. However, I had so much trouble corresponding via email that I'm sure a number of people got pissed off wondering why I wouldn't communicate with them, and I *know* the whole mess just disgusted me - so much so that I finally got sick to death of bounced email and wrong addresses and just threw all the gear in my basement. So, please - don't contact me unless you know for sure that your message will have a *VALID* email address in it to which I can reply. Also, if the last time was any indication, you needn't bother replying if this message is more than a day or two old - just assume the stuff is gone. Thanks.

Source record: 106542

>NF = 10 log[(Eni^2) / (Et^2)]

> = 10 log[(Et^2 + En^2 + (In^2 * Rs^2)) / (Et^2)]

In a 50 ohm RF system, I find the following useful:

input noise power(in dBw) =
-174 + 10*log10(Bandwidth) + 10*log10(Noise Factor - 1)

Noise Factor is 10*log10(Noise Figure)
-174 + 10*log10(Bandwidth) is the noise in 50 ohms at room temp.

e.g. for a system with 2dB noise figure and 2400 Hz bandwidth,
the input referred noise is

-174 + 33.8 - 2.3 = -142.5 dBw or -112.5 dBm which is about .53 uV rms

>
>John, KM6LJ

I used a miniature relay to substitute for the shorting board in the final's current circut. Using the normally-closed contacts, full-power is availible. When the transverter is on, it energizes the relay and makes the final almost dead. The output will vary, but I get about 1/2 watt at the antenna jack. You can bring the relay coil wire out through that molex jack.

There is a pot for adjusting the output power, I used a simple switch
mounted to the side that would select one of two pots for high and low
power.

1922. Crystal filters

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-25 00:00:00 UTC
From: mack@mails.imed.COM
Message-ID: <9602258277.AA827772952@mails.imed.com>
Source record: 106550

Isaac:
Actually it is *easier* to make SSB crystal filters by
starting at a *higher* frequency. Your idea of multiplying the audio
by four, modulating and then dividing has a lot of fundamental flaws.
Your original, basic idea is actually quite feasible!

You didn't put a call sign or address in your message so I
don't know where in the world you are. If in the US, get a copy of
the ARRL handbook and read the part on SSB about 20 times (At least
that's how many times it took me when I started :<)).

There are some very good articles about using microprocessor
crystals for sideband filters. One article in particular describes
filters appropriate for both USB and LSB. The filter configurations
are different for the 2 types. There have been about 7 articles in
QST and one or 2 in Communications Quarterly on this subject. I have
built filters for 4MHz and 16 MHz that very closely matched the
predicted responses. It will take a while for me to track down all of
the article references, but I keep a photocopy of all the good ones
right here in my desk for reference. You will need a large batch of
crystals in order to get enough of them matched closely enough to make
2 good filters.

One additional note: it is *much* easier to make good transmit
filters than it is to make good receive filters. The reason for this
is that you can do a lot of the filtering necessary at audio
frequencies. Then the filter only needs to have good attenuation at
the carrier and the opposite sideband. The passband of the filter is
less critical as long as it is wide enough to pass the desired
sideband.

Feel free to e-mail direct if you have questions.

1927. LNA input design problem (double match ?)

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-25 00:00:00 UTC
From: elendir@enst.fr
Message-ID: <4j70ac$a0l@tempo.univ-lyon1.fr>
Source record: 106555

Hi -
once more, a question. :-)

In the process of designing an (hypothetic) input stage for my 50 MHz transverter, I have, of course found some good filters that are 50 ohms input and output.
I have also selected an appropriate Dual-Gate MOSFET (BF 998) given for less than 0.4 dB @ 50 MHz.

The classical design process would be, regarding the input :
to design an input-impedance matching network to xform the 50 ohms into Gopt.

But, if I do this and connect the filter to the input design, its characteristics shift, because the input network does not transform the Yin of the BF998 into 50 ohms !

What am I to do ?

How to design an input stage that will both xform :
50 ohms into Gopt to be seen by the BF998 AND
Yin into 50 ohms to be seen by the filter ?

Thanks !
Vincent

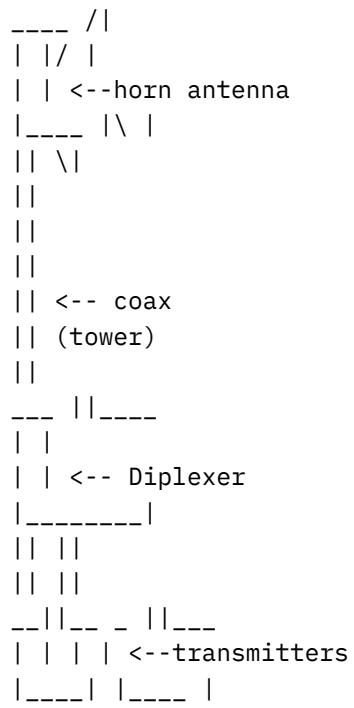
1928. diplexer design

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-25 00:00:00 UTC
From: jacosta@hiline.net
Message-ID: <4j75pc$6qi@mercury.hiline.net>
Source record: 106556

the project I am working on requires a diplexer to be designed:

Transmitter:



XMTR#1 XMTR #2

In this system, the outputs of two transmitters operationg at
different frequencies are combined using a device known as a
"diplexer", are sent up a long cable to the top of the tower, and are
transmitted using a horn.

The diplexer, to operate, must take energy from transmitter #1 and
deliver it to the antenna, without letting any enrgy get to
transmitter #2, and vice versa.

What I was wondering is how a diplexer design can be acheived. That
is after BP filtering the desired frequencies from each transmitter
with parallel stubs, can I just connect the two XMTR output lines and
expect them to mix?

Thanks for responding.

A circuit that splits a broad spectrum into two narrower segments, for example for using a 146MHz/440MHz antenna with two rigs or a dual-band rig with separate antenna connectors for each band; or using a single-connector dual-band rig with two antennas.

: differential coupler be used to model it?

Differential coupler? If you are thinking "directional coupler," then no, they are not at all the same.

I made a satisfactory diplexer from a small handful of coils and pF-range capacitors, three BNC connectors, and some copper-clad board. There have been designs in QST.

1936. Digital Voltmeter circuit needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-26 00:00:00 UTC
From: k2ek@aol.com
Message-ID: <4j93s0$bt2@newsbf02.news.aol.com>
Source record: 106481

Hello -

I would like to use digital display for an az-el rotator system. What is needed are 2 dedicated
DVMs capable of reading 3.60 and 9.00 volts respectively... Obviously I do not want to tie up
multiple DVMs. Seven segment LED display would be ideal.

From what I have found on my own, it looks fairly simple using an A/D converter and PC. Close,
but still not practical.

Does anyone have a handy volt meter circuit for driving LED (or LCD) displays from an A/D - or
point me in the right direction?

Are there alternatives? I thought about using a timer chip and counter. But that seems overly
complicated and harder to calibrate.

Thanks...

Bill K2EK

Help!
Several years ago I saw a discussion on using 10base2 ethernet cards connected to InfraRed emitters/detectors fo a high speed link. It seems a $20 10MBps card and some 'simple' IR gear will make a very nice high speed point to point link. The problem is, of course, I can't find the information I saved and surfing hasn't helped. I'm pretty sure it was a ham usnet group that was discussing this stuff around 1992.

Any help or pointers ?
Thanks

From: BlueSky@tiac.net
Message-ID: <315852A6.31B3@tiac.net>
Source record: 106486

Can someone help me by pointing me to a schematic or an article of a small VHF transmitter? It is
to be used to relay telemetry from a series of high altitude rockets. Following are the (desired)
specs:

Frequency: 2m band or nearby; XTAL controlled;
RF Power: 50-250 mW output;
Supply: 9-12 VDC (battery);
Modulation: N/A

Complexity (ie. size and weight) should be as low as possible, as should the cost - lets face it -
the typical life of these devices will be measured in minutes. I would preffer to build the xmitters myself as integral part of a telemetry package.

I have hundreds of various scanner crystals that fit in this category. They have fundamental
frequencies around 16MHz, but I don t really know if I can use them for this project.

I would very much appreciate any help in this matter. I can be also reached at

mailto:BlueSky@TIAC.net

My thanks to all those who reply!

1945. Thermistor mounts needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-26 00:00:00 UTC
From: Bob Mueller <IFF161@DJUKFA11.BITNET>
Message-ID: <96086.214223IFF161@DJUKFA11.BITNET>
Source record: 106490

I would like to obtain one or two thermistor mounts for a microwave power meter so I can study the construction and maybe also ways to get dead ones up and running again. I would like the sort for coaxial cable, not for waveguides. I would expect to repay you the cost of shipping and something besides for the help and trouble. I do not anticipate finding anyone offering functioning mounts, though I welcome any offers for those if you have one gathering dust!

Bob<iff161@DJUKFA11>

PS I don't care much about who made them; I'll probably learn as much from any decent brand and there have been several companies who made them.

1946. 6 or 7 port reflectometer for getting s parameters

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-26 00:00:00 UTC
From: klopfer@natinst.com
Message-ID: <4jafck$gdr@eagle.natinst.com>
Source record: 106491
Cross-posted to: rec.radio.amateur.homebrew,sci.physics.electromag

I've been looking at some articles on 6/7 port reflectometers. I'm wondering if anyone has used such a device to get s parameters of a device. I'm looking for an inexpensive alternative to a network analyser. Several of the articles have mentioned using the method of "sliding terminations" to calibrate these. Does this method involve the use of another calibrated device to calibrate the reflectometer? Are there inexpensive devices that have a variable calibrated impedance in the 1-10GHz range? One article on calibration of these reflectometers had a diagram with one block for a variable phase shifter and on block for a variable attenuator. Does anyone have a suggestion for specific devices that could be used for these functions. Thanks for the help.

If you really like to "roll your own", you can knock something together with some A/D chips and a couple of displays. You might be able to cobble something together with a Parallax Basic Stamp and an LCD display from Scott Edwards.(Computer control might be nice. The chip has simple A/D capabilities.) Or, you could just BUY two digital panel meters from someone...Digikey carries 'em, I know.

Perhaps that test should be qualified a little more. The hotter the material gets, the lossier the material is when subjected to microwave frequency electromgnetic fields!
That test doesn't necessarily indicate loss at other frequencies, or for one field or another! For example, a tree provides very little absorsion of HF electromagnetic fields,yet it will almost totally absorb microwave frequency energy. A magnetic material may be very low loss at HF, and extremely dissipative at UHF or higher.

Try the RC hobby suppliers/magazines, the battery distributors seem
to target the radio control guys more than hams. I've been getting
most of my cells from Tower Hobbies (Sanyo Cadnica cells -- they also
have NiMH cells (with and without solder tabs)), they seem to have
better prices than the ham suppliers do (not an ad, just a satisfied
customer).

MCM Electronics (don't have the number handy) sells replacement off-center fed 18" dishes (DBSS style). They're about $15, I think. N1BWT wrote an article in QEX a month or 2 ago on how to mount-n-feed em for 10Ghz. They work very well - a friend of mine has one up and running. I would too if I hadn't already picked up a 24" dish for quite a bit more :(
I'll try to find the MCM's number later and post it.

I guess it depends on what you want to homebrew. If it's electronic
equipment, you're in the right spot. If it's beer, try
rec.crafts.winemaking or rec.crafts.brewing, If it's homebrew sin,
try the alt newsgroups.

-DVMs capable of reading 3.60 and 9.00 volts respectively...

There are tons of surplus panel-mount digital meters out there for about
$10-$15 out there. Even Rat Shack has one (277-303, RSU11461498) for $19.
Look in the back of Popular Electronics or Electronics Now...

These are all digital voltmeters with a 0-199mV range. Just feed it
with a resistive divider to scale it. It's a lot easier than building your
own. If you reall want to build one, look at the old Intersil 7106 and
7107 chips; that's what is used in most of those panel meters,

: multiple DVMs. Seven segment LED display would be ideal.

Why not, you can get digital panel meters or radio shack grade pocket DVMs real cheap. Jameco has some LCD DPMs for $15 in the last catalog I checked. Bound to be some LED units in the surplus market.

If you want to roll your own, the common DVM chips are the 7106, 7107, '16, '17, '26 from Harris (formerly Intersil), Telcom (formerly Teledyne Semi.) and Maxim. (Digikey sell both Harris and Telcom, about $5 for the chip.) One type is has a multiplexed LED driver (the '7 chips) , the other drives LCD displays (the '6 chips). These are 2000 count dual slope integration method voltmeters in a single chip. Good for +/- 2.000 volt or 200.0 mV as normally used, but you can use another reference voltage and get any calibration you want within the chip's range, and divide it down if it's bigger. Be aware, the datasheets on these chips are kind of murky.

Harris has a good web site (I think it's www.semi.harris.com).

> - Patrick Mooney
>

Step 1: Build an LC Colpitts oscillator that oscillates at the frequency
of interest (no xtal yet). Be sure to put in an adjustable capacitor so
you can tune the frequency to within 1% of the crystal frequency.

Step 2: Now insert the xtal in series with the emitter as far as RF current
is concerned; you'll need some other method of DC return since DC can't
go thru the xtal.

Step 3: Adjust tuning capacitor (see step 1) for maximum output power.

Step 4: If desired, put a 10 to 60 pF. trimmer capacitor in series with
the xtal to trim frequency.

1958. Plans for 2m SSB 10w-to-??? Linear Amp?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-26 00:00:00 UTC
From: boardman@cobra.unm.edu
Message-ID: <4j99o8$rqk@lynx.unm.edu>
Source record: 106563

I've been looking for a linear amp to use with my Icom IC-211 2 meter all-mode rig, which only puts out 10 watts. Most of the commercial amps I've seen are either designed for HTs and use 2-5 watts in for 30-40 watts out, FM only, or are desinged for the newer and more powerful all-mode rigs and use 25 watts in for 150 watts out. The 1996 _ARRL Handbook_ only has plans for a 2m "brick", for FM only. If anyone knows of a commercial amp that meets these requirements, I might consider it, but I'm leaning towards building my own at this point. If anyone knows where I might find a good set of plans for such an amp, I'd appreciate a pointer. I'm open to either an all solid state or a tube design, that could be built by someone with a modest amount of experience in kit building.

TIA,

-Bob

From the Murata catalog, The CFM-455-D (did not see a D1 suffix listed)
has the following specs:

Center Freq.: 455KHz
3dB BW: +/-7KHz (min)
6dB BW: +/-10KHz (min)
Ripple 3dB (max)
60dB BW: +/-20KHz (max)
Insertion Loss: 3dB (max)
In/Out Impedance: 1500 Ohms

The radio comes apart real easy. Four screws on the bottom (after you
remove bat pack) one screw on back. Try to memorize how the battery
attachment goes on, be careful here. The rv1 mic adjustment is
backward, ccw=increase gain. Never tried the other pots. I think RV1

will bring up the TT levels as well as the mic gain. This pot is
labled MIC also and you can see it has a blue shaft (in my radio)

Most hoods and trunk lids are bolted to the hinges. Just remove one
of the bolts and clean the paint off before you replace the bolt with a
good sized electrical terminal lug and a "star" washer under the head. No
drilling OR epoxy needed. It's simple, unless I'm missing something.

You'll have to pardon me, as I'm joining this thread rather late, but the heading caught my attention. I have several projects Im developing at work, most of which involve small to medium sized circuits, usually with 4 or 5 ics and a handful of discrete parts.

What would be a good (inexpensive) software package to use to translate my schematics to a pattern for a board. Does the software you propose generate an output format that I could sent to a pcb house from which they could etch and drill my boards? (Obviously paintbrush does not.) Have you used paintbrush with IC based circuits? How do you translate dimensions on the screen to dimensions on your printout? (How do you make sure that ic pads are on .1 intervals, for example.

Whats the cheapest software you can get that will autoroute or rubber band?

Please copy your comments to my email box. Thanks.

has anybody got any comments on the T-Kits 1209 2M -> 6M
transverter kit?

I'm looking at this kit for my next project.

I've built the Ramsey 2M PA, and several other kits, without
too many problems, so I've got a bit of kit building
experience.

How difficult is this kit? how good is the quality?
Are there other kits that are better that do the same
thing (2M->6M)?

Is 5W output enough to get started on 6M (I can add a PA
later -- maybe as next year's project :)).

regards,
Dean.

Actually, measuring R is just about as tricky as measuring L and C, because it's an EQUIVALENT resistance, not something you'd measure with your DVM.
The RLC values of the crystal can be accurately inferred by measuring the series resonance properties of the unit(remember, a crystal doesn't really have an intrinsic parallel resonance; it's caused by parasitic capacitance interacting with the RLC series components). Any, back to the problem...

If you have a stable frequency generator which can be manually swept over a very small range (like a few kHz), and a rudimentary power measurement device (like a HF receiver w/S-meter), then you are equipped to make an indirect measurement. Connect the generator to the receiver through a couple of 50 ohm (or other known impedance) attenutaors (exact value not important...only used to insure that the crystal "sees" a known impedance. Connect the crystal at the junction of the 2 attenuators to ground. Slowly sweep the generator through the crystal frequency until you find a "dip" in the signal level. The dip is due to the drop in crystal impedance caused by its series resonance. The depth of the dip is determined by the equivalent resistance at series resonance, and is easily calculated.

Next sweep the generator back and forth around the null point, and determine the frequencies at which the signal comes back up some predetermined amount..say 3 dB. This is the bandwidth of the resonance. Remember that the loaded Q of a resonant circuit can be expressed as Q = Fc/BW. Calculate the Q.
Remember also that Q=X/R, or X=Q*R. Calculate X (reactance), from which you can then calculate L and C.

> I'll try to find the MCM's number later and post it.

Me again - MCM can be reached at 800-543-4330. And yes, the feed can be tricky,
but the off center feed does move all of the obstructions out of the pattern
and can make for a much more efficient antenna. See Pauls article.
Once you establish the geometry of the system,,
you can fix a parallel rail below the dish and mount a compass and even
a crude peep site for aiming.

What type of feed you do recommend? An article by Paul Wade in the
1995 QEX indicates that a simple rectangular horn feed gives excellent
efficency, at least when compared to the best center fed dishes (10 GHz).

Zack KH6CP/1 13 grids on 10 GHz--anyone in FN23, FN24, or Montreal?

Maplin Electronics here in the UK on (01702) 552911 have a satellite
book with details of weather satellite Rx construction. Cirkit on
(01992) 448899 do a weather satellite Rx kit, and PC software to go
with it. Spectrum Communications on (01305) 262250 also do a weather
satellite Rx kit.

> >Mhz??

As soneone said, thats not quite how its done. However, a crystal filter with a bandwidth of 2.4kHz at 1MHz would be practical. In fact, even at 10.7MHz, filters with SSB bandwidth can be found.

If you make your IF lower, say 10KHz, then you could build active filters with op-amps to have the required selectivity, but then the image rejection would be poor.

>
> Is this an AM bandwidth, FM, SSB? I found it in a homebrew
> circuit hanging off of a CB set in a hamfest. The original
> homebrewer 15 yrs ago obviously knew what he was doing, but for
> some (?!) reason the schematic wasn't included in the $2 price !

My Murata catalog gives the following specs for a CFM455D
ceramic filter.

Multielement Ladder Filter
Center Freq: 455 +/- 1.5 Khz
6dB BW: +/- 10 Khz
50dB BW: +/- 20 Khz
Ripple: 3 dB within 3 dB BW; 6 dB within 6 dB BW
Spurious Res: 50 dB min
Insr loss: 3 dB max
Input Z: 1500 ohms
Output Z: 1500 ohms

Unfortunately the pinout is not shown in my catalog. It
appears as a rectangular can with four leads on the bottom, one in
each corner. There is a tab on the bottom of one long side of the
can. My *guess* is that pins 1 and 2 are for input and pins 3 and 4
are for output. The long side is shown to be 20 mm long and the short
side 7.5 mm with a height (not including pin or tab length) of 10.5 mm.
Looking at the bottom, with the tab toward you, pins 1 and 2
are on the left (pin 1 is above pin 2) and pins 3 and 4 are on
the right (pin 3 above pin 4). The catalog does not show
prices. I have a phone number that was good on 7 Aug 1995:
(617) 356-4155. I hope this helps somewhat.

>>NF = 10 log[(Eni^2) / (Et^2)]

>> = 10 log[(Et^2 + En^2 + (In^2 * Rs^2)) / (Et^2)]

>In a 50 ohm RF system, I find the following useful:

>input noise power(in dBw) =
> -174 + 10*log10(Bandwidth) + 10*log10(Noise Factor - 1)

>Noise Factor is 10*log10(Noise Figure)
>-174 + 10*log10(Bandwidth) is the noise in 50 ohms at room temp.

>e.g. for a system with 2dB noise figure and 2400 Hz bandwidth,
>the input referred noise is

>-174 + 33.8 - 2.3 = -142.5 dBw or -112.5 dBm which is about .53 uV rms

While it doesn't really address Vincent's question, I offer the following:

In his book "Noise Performance Factors in Communications Systems", W.W. Mumford says, in concluding a discussion on noise figure definitions:

"The reader is cautioned to ask which definition of noise figure is being used before he enters into any profound discussion of it."

That said, I step on the slippery slope and state that the generally accepted definition of noise figure is noise factor expressed in dB, e.g. a noise factor of 2 is a noise figure of 3.01 dB. This is in opposition to Alan's usage.

Also, the usual equation for input noise power (Ni) is:

Ni = kTB

where: k is Boltzmann's constant = 1.38 * 10 ^ -23 joule/ deg K,
T is the source temperature, usually taken as 290 deg K,
B is the effective BW in Hz.

letting B = 1 and using the log form, 10*log(kT) = -204 dBw = -174 dBm. Note that Alan used -174 for dBw, which is also incorrect.

Leaving out the derivation, it can be stated that the noise power at the input of a system (at 290K) is kTBF where F is the noise FACTOR or in log form, -174 + 10*log(B) + NF(dB) dBm. Therefore, with a 3 dB noise figure, the equivalent input noise power is -171 dBm/Hz.

Because it is now 12:10 AM, I will conclude, hopeing that I haven't made too many mistakes.

> amount of experience in kit building.

Bob:

I strongly suggest that you use a tube amp. Most solid-state designs (unless
you use a 24V MOSFet) have too much distortion and sound like hell. A single
4X150 with 1200-1500 V on the plate will give you a conservative 100-200W out.
If you are interested, I probably can dig out a couple of papers on the
subject.

I look forward to a two meter QSO.

Hi Dean,
While I have not built the TT kit I did hear a # of them on 6M last Es season- they were consistantly the nicest sounding sigs on the air. Previous postings here indicate the instructions hark back to the excellent days of Heath. Note also they now have a 2M to 6M downconverter to place your 2M all-mode on 6. I've been told the 1st run is sold out! I have no affiliation w/ TT in fact I don't own a TT!- but if I had serious interests in HF I would own nothing but TT.

: R is easy but L & C stump me.

The LC product is measureable very accurately, an LF measurement will
get the case capacitance. Look at the difference between parallel and
series mode resonances, then do them again with a known loading capacitor
added. You now have enough to calculate L and therefore also C values,
though the acuracy will be somewhat less than the LC product...

Cheers

Thanks for the reply. What I was looking for is a circuit or
theory of operation.

I can design a test set based on the above info. A tube version
would be OK. I can translate.

The thing I don't like about those DSS antennas is that they are
off-center feeds. This gets your feed out of the way of the signal into
the dish, but I have always had a harder time pointing the things.

Philip,

For absolute reliability nothing beats a standard fuse of correct rating. Breakers more often fail to break than fuses fail to fuse. Statistics on record will back me on this, but if pressed it would take a long time to find those records. Would this aircraft tolerate the additional weight of closely matched breakers backed up by fuses with a greater margin? This would offer double protection (something aviation adores) with the convenience of breakers. The idea is to have the breaker trip before the fuse blows. If the breaker fails (doesn't open on overload), then the fuse goes. If the fuse ever does blow in such a system... you know it saved your life!

>

The impedance is much lower than the simple resistance calculated by the current and voltage.

The only accurate way to calculate the impedance is to know the maximum available fundamental current and voltage at the anode under operating conditions. That can be done by using the constant current characteristics of the tube to determine the loadline and fundamental voltage and current.

The older ARRL Handbooks give some simple rules of thumb that are pretty good. The new Handbook has some theoretical errors on matching, so I'm unsure of it's accuracy. That section may still be correct.

With a typical class B amplifier the correct source Z is around half the dc plate impedance calculated by the operating E/I. So the sweep tubes would be ~650 ohms and the 3-500Z will be ~3000 ohms, depending on the conduction angle.

I think a more simple change would be to use parallel 811A tubes, rather than a 3-500.

The common "wireless mike" kits that are pretty commonly available for the FM broadcast band are, I believe, also available for the 2m band. Some of these kits have power outputs in the lower end of the power range you're looking for, and can be powered with 9V batteries.
Have you looked for ads for these cheap, easy-to-assemble kits? I know that they're available in the frequency range you're looking for, but I don't remember which manufacturer offers them there. Ramsey, perhaps?

Don't forget that the DSS is an OFFSET FEED type and requires
a different feed than you would use on a center feed dish. The offset
feed is better though.

>
>What am I to do ?

I'm no expert in this (I've been waiting to respond in hope that one
of the real experts would answer), but I've got the following
comments...

It sounds like you're using the FET in a common-source configuration,
and the gate is primarily reactive, with a fairly small series
resistance. An LC matching circuit at the gate is going to have a
fairly high Q, and will only provide a 50 ohm match over a limited
frequency range. Moving outside this range, the input impedance
will rapidly become reactive.

LC filters depend on non-reactive termination; as the termination
becomes reactive, the LC filter characteristic changes. With a
filter, the termination outside the desired bandpass is at least
as important as the termination inside the desired bandpass, and
the matching circuit to the FET gate is almost certain to
mis-terminate the filter - something you've already discovered.

>How to design an input stage that will both xform :
>50 ohms into Gopt to be seen by the BF998 AND
>Yin into 50 ohms to be seen by the filter ?

If you want to use the FET amplifier to terminate a filter, you'll
need to make the FET have a non-reactive input impedance over a
fairly wide range (at least an octave above and below the desired
bandpass frequency). You can do this by shunting the FET gate

to ground via a resistor, and then use a broadband transformer to match the filter to this resistance, or you can use an amplifier with an input characteristic more suitable for terminating a filter. The problem with shunt loading the FET is that you'll certainly degrade the noise figure, perhaps dramatically. A grounded gate FET happens to offer a well-defined input resistance without compromising the noise figure, which makes it a natural choice for terminating filters (and mixers, too).

Most LNA designs I've seen have very little in the way of input filtering, instead depending on the narrow band nature of the input matching circuit to give some filtering. If you don't expect to have a lot of strong interfering signals on nearby frequencies, you're probably best off using the simple matching circuit before the FET amplifer, and the LC filter after the amplifier. Afterall, the insertion loss of the filter would directly degrade your noise figure if you place it in front of the amplifier, but will have little influence placed after the amplifier if the gain of the amplifier is significant.

Alternatively, you could investigate changing the amplifier configuration to common gate.

A diplexer consists of a high pass and a low pass filter with their
outputs Teed together to feed the antenna. The theory is that each
filter presents a very high impedance at the other frequency, so that
it beomes essentially "not there" to the other signal. Thus the signals
behave as if they were directly connected between the antenna and
their respective radios. The filters may require additional stopband
elements for the opposite frequency to achieve this.

Older-style MMDS receive dishes were made with detachable feeds and
were commonly available in 18", 21", 24" and 36" sizes. Many
MMDS system operators have now begun to use dishes with integrated
downconverters, and some have a surplus of the older style dishes.

If you're in a large metropolitan area, see if there's a Wireless
Cable operator neaby. A call to one of the technicians or the
installation crew manager might get you what you're looking for at a
very reasonable price.

Incidentally, these are all center-feed designs.

Hi,

Several years ago now I bought (cheaply) a HF transceiver which
was badged "AEL 1201". The company AEL claimed to have no knowledge
of such a radio. Recently I learned that the 1201 was actually
only distributed by AEL and then only for a short period. It seems
the radio was built by Cubic Corporation (I think). I would be
very grateful if anyone could supply me with contact details for
Cubic, or better still, let me know where I can get information
(just the schematic would be great) on this radio. It has a
TTL based synth giving 12 channels and I would like enough info
to be able to homebrew a replacement synth/VFO.

Many thanks,

David

Hello Dean,

I received my 1209 2m - 6m transverter kit last week, but have
not started assembling it yet. The kit looks good as does the instruc-
tion manual. Lots of small parts! It has an attractive case and appears
to be complete.
Yes, 5 watts (8 watts actually) is plenty of power to operate
on six meters. Not to worry. As you say, you can add an outboard amp
later if you feel you need it.
All I can say is that I am impressed with the kit and am look-
ing forward to getting it on the air.

I think your email is very interesting. I was thinking of a device to measure S11 and S21 with the accuracy needed in ham use. I can't contribute any help, but was considering the use of a directional coupler. This would be oK for magnitude but phase angle would be more difficult. I think down conversion to base band and then a phase detector might be one way to go.

I am not familiar with the 6/7 port reflectometer and you mention some articles. Can you tell me the articles?

Currently my equipment is an Alfred sweep generator and an HP 8551 spectrum analyzer. That's about what my budget can afford. The network analyzer is way out of the question.

2019. schematics for VHF amp using 2c39 / 4cx250 ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-28 00:00:00 UTC
From: Peter Dingemans <129432pd@mstore.eur.nl>
Message-ID: <Pine.PCN.3.91.960328180505.7053A@[130.115.53.110]>
Source record: 106447

G'day everyone,

I'd like to know if anyone has schematics for a VHF amp using those valves (esp. the 2c39). Even though valves may seem old-fashioned, they're still the cheapest way to get quite a lot of power in the air for very little money. (a used 2c39 costs about 10 dutch guilders, which is about 7US$). Compare that with the price of a BLX/BLY VHF power-transistor!

I know there are still quite a lot of amateurs around who use these valves, and if they have a simple schematic, I'd like to hear from them. I currently have some schematics for the 2m and 70cm, but they use coaxial techniques, while I'd rather use 'normal' wound coils (much easier to build/modify).

So, if anyone has a simple schematic or any experience with tube-amps, please let me know.

Also, any web-sites with schematics or any other info on using RF-valves will be appreciated. I've been looking for a week, but have found practically nothing.

Have a nice day,

Peter Dingemans,
Rotterdam,
The Netherlands.

Bob, you might learn just as much about these mounts by looking back in
older Ham Radio magazines for a homemade mount constructed with 1/200 amp
fuses. We used to construct these and use them without effort as high as
1296 Mhz for little more than the cost of the fuses. Cliff Buttschardt W6HDO

I can't help you find the information you need, but if you do find it, I'd be interested in seeing how they do collision detection; that's what's kept Ethernet off radio for years, and caused AT&T to develop WaveLAN, for example. Please post the results, if you find them.

Thanks and good luck.

Hi Isaac ,

The Swan 350 covers 3.5 , 7, 14, 21 and 28MHz. I used one for many
years but it has been retired for about 10 years now. The Schematic
Diagram I have is dated 1965 so it is a very elderly set. Also it
doesn't have IRT....important if you like CW.

You only need one fuse, located right at a battery terminal, to break
the circuit. Using 2 fuses only increases voltage drop.

I suggest you use independent wiring for the radio and the
instruments. Both circuits independently fused, right at the battery
terminal, by fuses rated below the current carrying capability of the
wiring. This will prevent the wiring from igniting in case of a short.

Seeing the loads are pretty much fixed, you can even decide to reduce
the fuse rating to just above the full working load, using slow blow
fuses to accommodate turn-on surges. this will extend protection to
your radio and instruments when they develop a fault resulting in an
unusually high current.

A comment on breakers vs fuses. Breakers often have both thermal and
magnetic trip values. The magnetically sensed breaking action is very
quick, the thermal action much slower and dependant on the amount of
overload and the duration. The magnetic trip point is usually several
times the nominal breaker rating. Fuses rely on thermal action only.

2029. Amp. Tank Circuit

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-28 00:00:00 UTC
From: Mike Sims <nasfred@interserf.net>
Message-ID: <315B297E.1352@interserf.net>
Source record: 106457

Situation is a 4CX1600 amp. using a pi/L tank. The amp./tank circuit works okay on 20, 15 and 10 meters (efficiency). However, on 40 and 80ty meters the efficiency is way off and the output capacitor on the tank circuit are at max. capacity. I have padded additional capacitance across the output capacitor to above the calculated value. The tank's input capacitance tunes the band okay. The amp. has been tried at the upper and lower end of 80ty and 40ty. The amp. is working into a big dummy load (five gallons of transformer oil with two 15 inch non inductive 100 ohm resistors in parallel in the oil).

The L or output coil is made of a small air wound coil for ten meters and a coil wound on three T200-6 toroids using number 12 wire. The inductance and appropriate taps was measured using a Autek Analyzer at the frequency of use.

Will be trying an air core coil on forty meters to see if the toroid is causing the problem.

Any answers of suggestions?

Mike, K4GMH

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:

: A diplexer consists of a high pass and a low pass filter with their
: outputs Teed together to feed the antenna. The theory is that each
: filter presents a very high impedance at the other frequency, so that
: it beomes essentially "not there" to the other signal. Thus the signals
: behave as if they were directly connected between the antenna and
: their respective radios. The filters may require additional stopband
: elements for the opposite frequency to achieve this.

Exactly so. The "not there" can be achieved with a parallel-tuned trap
in series at the input to a filter, which is tuned to reject the other
band. Then the reactance that trap has on the pass frequency must be
included in the design of _that_ path. Or, you could use a series-tuned
shunt trap at the input to a filter and connect the filter through a 1/4
wave transmission line so that the short circuit the trap represents
reflects back as an open for the other band. Be sure to keep your
bookkeeping straight, so you know which circuit is a short on which
band, and which line is 1/4 wave on which band, etc. !! Another
alternative (really more just an alternate viewpoint of the same thing)
is to include the reactance that each filter reflects back to the
junction in the calculations for the other filter.

I once made a six port reflectometer. You can make a six port coupler. It is a 3D object. Imagine two Y-junctions stacked above each other and separated by lambda/4. Then connect the ends of those 3ports together with 25 ohm line(2 50 ohm lines in parallel.) The six outputs come of the edge of the boards that the Y-junctions are printed on.

This actually worked as reflectometer. Put source at one port. One diode detector goes to X-axis of scope, One diode detector to Y-axis of scope. One port to unknown, remaining ports terminated.

A sliding line with short circuit at end traces a perfect circle (the outer edge of the Smith chart.

Got the coupler idea from old MTT article. May be able to find it.

A recent article about these reflectometers is in IEEE trans. Instruments and Measurement vol 45, no 1 Feb 1996. I don't understand enough of the terminology for this to help me but it has references. I was looking at the Dec. 1977 issue of IEE Trans. Microwave Theory and Techniques. This has several articles on 6 port reflectometers and some look like good introductions to calibration. There's a Dec 1991 article of IEEE T I & M that's titled "A wideband millimeter wave six port reflectometer using four diode detectors calibrated without a power ratio standard" which I haven't read but the title gives me hope that this can be calibrated without requiring the use of any calibrated device.

>Amateur back in radio. THANKS!!!

Heathkit, Collins and many others used the 6146 and its variants long before the Japanese entered the market. Yes, it's a good, rugged design and probably the most appropriate to the 100 watt output level. Actually, a pair of 6146B's will deliver about 120 watts in class AB1 (SSB/CW) and about 160-170 watts in class C (CW only).

There were a number of 6146 designs in ARRL Handbooks during the 60's and early 70's. The '72 Handbook described a heterodyne-type CW transmitter with (2) 6146B's that included a built-in T-R switch for QSK. The transmitter was a hybrid (only the driver and finals were tube-type), but it covered 160 thru 10 meters (no WARC).

Incidentally, as much as I enjoy the glow of tubes, I wouldn't personally build a transmitter with a tube-type final at this power level. If you do, be prepared to scrounge *many* parts at hamfests, or to end up with a project that will be much more expensive than its solid-state counterpart. One option in this regard might be to buy a used Heath HW-101 or similar with the matching AC power supply and scrap the whole thing for parts.

However you decide to do this, I recommend that you become very familiar with the potential cost of the entire project (and determine whether parts necessary to complete it are even available) before you spend a nickel. Commercial tube-type transmitters are plentiful on the used market at reasonable prices. A homebrew version could easily cost twice as much and have little or no resale value.

>
> Thanks!
Hi Scott, there was a recent article in the March 96 QST with the
Harris chip.

I could only find two articles that used the AD7008 part, I thought
that there was at least one more, but I couldn't find it.
1. October, 1995 issue of 73 - page 14
2. December, 1995 issue of QEX

The QEX article was for a microprocessor controlled HF receiver, but
it used a 7008 for the VFO.

Both articles were interesting, but I didn't think that either one was
particularly informative. I liked the Digibrain article in QST
better.

You don't need any special type of antenna; the only thing you
have to be careful of, especially with high-gain directional
antennas, is that the SWR remains low across the entire band
segment your transmisison is being spread around. To link
remote sites to a central main site ("star" configuration)
I've used regular Yagis at the remote sites and an omnidirectional
multi-bay vertical at the central site, all on 900 MHz using
frequency-hopping SS. For shorter ranges patch antennas are
pretty common.

EVERYONE used a pair of 6146Bs with a 12BY7 driver... well, almost everyone.

Yes, that will make a good lineup. You can also use a pair of 807 or 1625 (the 12.6v equivalent) if you want to include the nostalgia element. For real fun, get hold of a 6L6 or 6DQ6... Either makes a nice 1 tube transmitter in the 15-25w range.

TV sweep tubes will work. One of my favorite activities was finding a junked TV by the curb on the way home from school and making a transmitter out of it by dinner time. The only "external" parts needed were a couple air variable capacitors, some wire and a crystal. Get hold of any ARRL handbook from the 60s or early 70s. They are loaded with ideas you can try and the tube tables are indespensible.

A lot of vendors have the "PM128" LCD DPMs for about $10. Circuit
Specialists also has the "PM129" LED version for $11.50.

I think these units use the 7126/7127. Note, they don't have a negative
supply generator, so the common mode input range does not extend to the
negative supply.

Yeah, there are several, actually. (I just moved from Alexandria). The
best, for my money, was Arlington Electronc Wholesalers, at 3636 Lee
Hwy (ph# 524-2412). Neat store..... the projects I could have done
from there! (drool, drool)
Also, for ham gear, try EEB (Electronic Equipment Bank) over in
Vienna. Those guys are the tops, both in price and "helpability".

Good luck!

Measure the Q and then 6.28*F*L = R*Q and 6.28*F*C = 1/(R*Q).

To measure Q, find the frequency difference between +45 degrees of
phase and -45 degrees of phase (or between the 3dB down amplitude points).
The resonant frequency divided by this difference is the Q.

>73's

Hi George,

The problem isn't the lack of a band switch, the problem is in the amps
(lack of) biasing and the basic circuit design. IMD problems will not show
up on a scope, and show up only on a spectrum analyzer if the amplifier is
operated with a two carrier test.

Most Palomars wouldn't operate outside the upper end of the HF
spectrum.
They only worked near the CB band (because the RF chokes were too small).

All of the Palomars I'm aware of won't be "clean" for SSB or AM linear
operation. Palomar intentionally used a bias circuit (in some amps) that
promoted positive carrier shift (forward modulation in CB talk). In some
there was no bias at all, and that's a bit better.

Even if the model you have has the grids all grounded (no bias), two sweep
tubes
driving four is real nasty for IMD (unless the model you have happens to
have all six tubes in parallel, then it's better)! Come on now, since the
vast majority of them were two tubes driving four, what amateur exciter
would fit the 3 watt drive requirement? And by the way, what's the FCC ID
number on that "Ham Amp"??

Palomar designed and marketed amps into the CB market. The bandswitch was
a "clever" way to get around FCC rules. Palomar sold those models right
before the FCC put them out of the illegal CB amp business permanently.
They were never actually intended to be marketed to Hams, just CB'ers.

The Palomar amps were a better class class of CB amp (as opposed to the
Black Cats that ALSO had band switchs), but it was still a CB amp. These
amps, and the little mobile CB solid state amps, paid little attention to
linearity.

73, Tom

: Any comments?

Some of the folk here doing prototyping in the 1-2GHz region were using a conductive ink successfully. It was heavily silver-laden. It was something sold in a "pen" for PC board repair work. Thier measured performance was only very modestly different from the plated through holes on the finished manufactured boards.

The way I've been doing vias on proto surface mount boards etched in my kitchen is to drill 0.0135" holes and put 30-gauge silver-plated wire-wrap wire through them, flattening over each end. The result stands off the board surface by perhaps 0.008", which may be more than you wanted for your RF seal, but if you put some RF gasket material in, it seems like it would OK. You could even run the 30 gauge wire all along that edge of the board, to make it uniform, if you can stand the height. (That's pretty thin material you are using!)

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.swap

I have a friend that has come into some real nice Motorola
VHF equipment. She would like to know what this equipment is
worth, as she intends to sell it all.

1st. She has 6 Motorola VHF Power Amplifiers.
These are BRAND NEW in the ORIGINAL boxes. They
were obtained during the closure of an Airforce base.
They come with a Long Power Cable, and a Long coax cable.
These are all packaged as to be installed in a mobile unit
of some type. They have a TO-220 transistor driving
an RF-Power Transistor that has House markings.

Motorola #N1274A, Frequency 136-150.7 Mhz
Kit No. NLD7701A

The Amplifier is all brushed Aluminum.
2.5"H x 4.75"D x 6" W

What are these worth?
==========

Next She has Qty 3, P100 T-Band hand helds. 470-495 Mhz.

Last 1 HT90, also T-Band. Some have holsters, and all
have batteries.

What are these units worth?

From: tiemann@spot.Colorado.EDU
Message-ID: <4jfg93$6k4@peabody.colorado.edu>
Source record: 106462

Teflon is impervious to almost everything. Including acids. Only two things are listed as being bad for it in tables of what plastics are compatible/ eaten by what chemicals. Only two get teflon: elemental fluorine, and molten alkali metals (sodium, potassium, etc...). For the latter, the reaction is basically C-F + Na -> C + NaF, the latter which is like salt (NaCl) and very stable. What happens to the carbon is its own problem, and the reacted surfaces become dark, suggesting soot-ification.

Teflon etchants based on the latter reactivity are dispersions of fine alkali metal particles in an organic (not water!!) based syrup. Not something to homebrew unless you are used to dealing with alkali metals, and not something to treat carelessly. But you can buy it.

But all the things you might be tempted to try: nitric, sulfuric, hydrochloric, hydrofluoric, and perchloric acids, and also Aqua Regia (HNO3 + HCl), Piranha (H2SO4 + H2O2), and also strong bases (lye, etc) have no effect on teflon.

>adhere properly. I presume that an acid is needed. Does anyone know
>which acid, what concentration, and how long? 73 Stan K8RPA,
>flegler@pilot.msu.edu
>
>
Not an acid, a very strong base. In the good old days, it was sodium
amide. Made by dissolving sodium metal in liquid ammonia, not something
I would want to do and I'm a chemist. These days sodium naphthenate is
used. You can buy it under the name Tetraetch. You dip the board in
the solution, then you have to rise off the naphthalene residue with
acetone and then hot water.

It is still not a real pleasant process. It is one reason printed circuit
shops don't like to work with Teflon. It is really needed to get a plated
through hole to stay in place.

You would be better off putting a wire through the hole and soldering
it to the copper on both sides, then cutting off any excess. Many
people use copper eyelet rivets if they can't do plated through holes.
The conductivity of conductive epoxy is not that great in as small a
cross section as a hole.

power-transistor!
>

Avoid coil type tank cicuit for 4CX250 and it's relatives when
working above 70-90 mhz. The circulating currents are unpredictable,
and the ovrall efficiency drops off rapidly. Coax tanks are forgiving
at 2M vhf after a small learning curve. Almost any ARRL handbook from
1965 to present has good homebrew amp ideas. Do you have access to
these books? 73 KD3SH

From: jlutes@netcom.com
Message-ID: <jlutesDp0oC9.I29@netcom.com>
Source record: 106471

Can anyone offer suggestions for the following:

I need to transmit 9600 baud asynchronous data via radio. I'm looking for the ultimate combination of cheap, simple, reliable (ok, pick any two :) The trasmitter/receiver system should meet the following criteria:
1) usable range up to 1/4 mile
2) crystal controlled frequency (for stability)
3) 9 to 12 volt power source
4) preferably FM
5) minimal parts count
6) receiver to have low quiescent current draw (preferably)

Being as how I am principally a digital designer, this is a rather daunting challenge for me. I'm hoping someone can point out an elegant, simple solution. I have several projects that would benefit (read: be possible) from such a system (both transmitter and receiver). Email is OK. Thanks !

I no longer remember what they're called, but when I was learning miniature and microminiature electronic repair in the Navy, we had these items that were essentially 'hole-liners,' and they worked great... They were sized to fit the through-hole, and had one rolled lip. The other lip was straight, but after inserting the item, the technician would flare the straight end, then flatten it, then solder both sides to the pads.

Other sources of cheap parabolic dishes include lampshades (read G3RUH's classic article), certain saucepan lids (my wok's lid looks about right... :-), some garbage can lids, and those saucer-shaped snow sleds. If the object is the right shape, but not conductive, a few minutes work with aluminium foil and glue will fix the problem.

There was also an article in VHF Communications 1/1995 on offset feed dishes. The 1/1996 issue has an article on simple VHF/UHF antennas, including short backfire antennas - the ones you can make out of cake pans. Just like the Phase 3D folks.

In the followups I am surprised that noone mentioned the
ARRL "QRP Classics" and older handbooks. Doug Demaw, W1FB,
wrote an article in QST on how to measure crystal parameters
Q, R, and others which I forget and don't have the stuff
here in front of me. The article had a couple of circuits
used along with a frequency counter to determine parallel
and series resonant values and crystal activity.

FAR Circuits has the PC board available and copy of the
article. To see the pricing for this board and others
go to ftp.LeHigh.EDU (caps to prevent you from thinking
that's a one instead of a lower case L in lehigh) as anonymous.
Change directory to /pub/listserv/qrp-l/catalogs and you'll
find two files, farlist.txt and farorder.txt. When you first
see them you will see a .Z appended. That means they are
UNIX compressed. Not to worry, when you do a 'get' do it
without the .Z and you'll get them uncompressed. Dweeb stuff
going on here gang. :-)

One file is the catalog and the other is order form, both in
ASCII. I got them from Fred on messy-dos disk and copied
them to LeHigh.

I am not a stockholder in FAR Circuits and not associated
with FAR Circuits. Just info for your use.

Source record: 106399

Hi,
I'm trying to connect with someone that knows a lot more about electronics than my bare-bones basics. I'm trying to design a circuit that will let me do the following when I hook up my HT in my car:

1- Automatically divert my regular stereo output to a dummy load when a signal is incomming to the HT and breaks the squelch (would prefer to be solid state switch, but willing to live with mechanical relays for each channel of the stereo)

2 - Would like to be able to divert the audio output from the HT (at the same time) to an amplifer on the circuit board and put through one or more speakers of the existing stereo system. (This is not as important as the first goal, but would be nice as a part of the whole circuit)

NOW - Some of the basics that I understand (so noone thinks that I'm a complete idiot <G>) :

- Know that I don't want to change the impedence on the HT's audio output and screw up it's audio output transistor...

- Know that if I DO use mechanical relays for the switching of the stereo speaker's output, will need to had diodes to prevent spikes

- Know that the general circuit design should be a case of a saturated transistor activating the switching action

- I HAVE built a circuit using a small audio transformer that worked, but would prefer to remain as solid state as possible (possibly even using IC's - considering the enviroment)

I know that this will require quite a bit of correspondence (will use bmp files zipped down to show schematic ideas)... I would prefer to be able to get most or all parts through a typical Radio Shack since some friends will probably want me to make more for them as well....

Okay folks - any patient teachers out there???? <GGG>

If you etch it first, epoxy adhesives will give a fairly good bond.
I forgot to mention in the other post that plasma etching is sometimes
also used. It isn't something most of have access to.

Stripline and mutilayer circuits using teflon boards are usually bonded
by use of a bonding film. The film is a fluoropolymer with a lower melting
temperature than PTFE Teflon. A hot press or an autoclave is used to press
the layers together and melt the bonding film. You can also do direct
bonding where the two boards are heated under pressure at a temperature where
the PTFE Teflon melts. That is about 700 F, so most shops don't have the
press that can reach this temperature.

In the early days of striplines, they did use rivets, screws, clamps, etc.
to hold the layers together. The problem is that Teflon "creeps", it flows
under pressure. The pressure of the mechanical fasteners would be releaved
by the creep and eventually the layers would not be held together tightly.

If the loading cap is at maximum C , it's a sign something in the tank is
off. Pi-L's can behave strange if component values are off. There are
several modes of operation the network could be in if some value is off.

What did you use for the median impedance of the network? By that I mean
the design impedance at the loading capacitors connection point. Or where
did you get the values?

How do you know the inductors are the right values when mounted in the
final operating location? Did you measure them (and how) or just calculate
the sizes?

>The L or output coil is made of a small air wound coil for ten meters
>and a coil wound on three T200-6 toroids using number 12 wire. The
>inductance and appropriate taps was measured using a Autek Analyzer at
>the frequency of use.

If the toroid core has tapped turns to switch bands, it could be trouble.
There isn't enough flux leakage to allow proper use of most cores in
tapped resonant circuits.
The mutual coupling can get you in trouble fast. I wouldn't trust the
Autek fully in this application, the simple scheme it uses to measure L or
C is subject to error.

Remember ferrous cores change permeability with frequency, so inductance
needs to be measured somewhere around the operating frequency. I don't
have any info on a -6 core. Maybe the material isn't good?

>Will be trying an air core coil on forty meters to see if the toroid is
>causing the problem.

That may be a good idea.

Another thing is all tubes can behave poorly on some frequencies,
depending on bypassing. Tetrodes are a particular headache.

Is the cathode grounded directly? How big is the screen bypass?

A frequency counter with a Period function is useful for this,
although you have to convert the readout to frequency. In the Period
function, the clock is reset by the signal, not the internal timebase.
So, the lower the frequency, the longer the elapsed time that reads on
the display. This is probably the best way to accurately measure very
low frequency signals.

Other than that, I suppose you could buy a counter with a 10 MHz
timebase and replace the crystal with a 1 MHz or 100 KHz equivalent.

Hi Mark,

I posted something to another radio group recently on this same topic. Rather than reinvent the wheel, I've reprinted it below. Incidentally, there is no need to connect the output of a solid-state audio amp to a dummy load. That's a holdover from tube circuits, where the voltage across the secondary of the output transformer could rise without a load and short the transformer. The only (resistive) load that's harmful to solid-state audio amplifiers is one that's too low an impedance.

Reprint follows:

This is difficult to do with passive circuitry because the signal from one radio cannot be allowed to feed back into the output amplifier of another. I can think of two ways to do this:

First, the output of each radio is fed to a high-value resistor (2-10,000 ohms). The opposite end of the resistors are tied together and fed to an audio amplifier that drives the speaker. Of course, this requires that power be applied to the mixer. If it is desired to separate the signals so that only one radio is heard at a time, some type of logic circuit would also be required.

The second method would work by sampling the output of each radio through a low-value resistor, say 20-50 ohms, and feeding each sample to a rectifier and filter. The output of each filter would drive a sensitive DPDT reed relay. One pole of the relay would connect the output of the active radio directly to the speaker, the other pole would be wired in a way to lock out all the other radios. There would be a *slight* connect and disconnect delay due to the filters,

but this would be a totally passive system.

Additional note: In the system you described, the second method above would only require one rectifier/filter and one DPDT relay. Also, do not attempt to use the chassis of the vehicle, the stereo or the HT as a common ground to the "negative" speaker terminal (in order to use a simpler relay). If you can't find the relay needed for this project and you need to leave the negative speaker lead connected to the stereo and HT all the time, be sure to check the speaker terminals first for the presence of DC. Higher power car decks apply 1/2 VCC (about 6.7 VDC) to both sides of the speaker.

"Macnet Roster" (ver. 739) has just been updated and is now a stand-alone application! The version number = the number of hams using Macs.

"Macnet Roster" lists:

o CALL SIGN @ HOME PBBS
o FULL NAME
o ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

of every known amateur radio operator in the world that uses a Mac computer.

You can use "Macnet Roster" to find other Mac users that you can then communicate with directly. Compare notes on software, applications, ideas, hints and kinks, and make new ham friends that use the same computer you do. (You already know how cool you are - imagine accessing "the rest of us"!)

If you'd like the latest "Macnet Roster":

Send me a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER".

Or connect to my home page via the WWW

http://www.mv.com/ipusers/wd1v

Put YOUR INFO (via EMAIL or disk using TEACH TEXT) if you'd like to be included in the "Macnet Roster" or send an update to your stats to me via pkt or email anytime.

Ramsey (yeah, I know) offers a frequency multipler for this use.
It multiplies the input frequency by 10x or 100x before presenting
it to the counter. This lets you measure low frequency signals with
better precision (if not accuracy) on an ordinary counter. I've
used it to precisely measure audio frequencies. An oscilloscope
and a precision frequency source is a better method, however.

For most HF work, I worry more about the dielectric constant than
the dissipation factor. Generally speaking, unwanted capacitance is
more troublesome below 30 MHz than the loss within the material.

Considering that glass has one of the the highest delectric constants
of commonly-used materials, I don't think the microwave test provides
any useful information in this regard.

This is what conductive epoxy is for - even thru-plated holes may not provide a sufficiently level surface to avoid its use. Many microwave equipment manufacturers buy the epoxy in sheets and sandwich it between the board and enclosure.

That was my first reaction, too. Flux is generated within the core as a function of volts-per-turn. This particular application probably places a considerable voltage across the winding and probably doesn't require a large number of turns.

My news server isn't showing the original article yet, but if the number of turns and the input/output impedance (or voltage across the toroid) was posted, I could calculate the flux.

The cores could be saturating, but that's unlikely. In that case, the
cores would be getting VERY hot.

Sounds more like the design impedance is way off.

>Tnx in advance. 73 Ken W6GHV

Avoid this method. We have even had trouble with plated vias on alumina substrates when they became filled with conductive epoxy that was used for component attach. The epoxy shrinks during cure and "detaches" the plating from the surface conductors. If inductance is critical (isn't it always?) the inductance of a solid via will be different from a hollow one. A ribbon through the hole is probably the best you can do.

Good luck,

>Any comments?

Hi, Ken.

It might be a lot easier to fill the holes with a small piece of wire soldered to the two pads you want "plated through." Manufacturers buy true double-sided boards to save production costs and time, but home constructors can usually afford the few extra minutes to do it the "hard" way.

BTW -- the 1995 ARRL Handbook has a nice sidebar on how to homebrew double-sided boards using this technique. It is found in the circuit-construction chapter.

After some checking, I found out that QSL cards cost anywhere from $70.00 to $450.00 per 1000 cards to be printed up. I also found out that you are pretty limited to the color of card, artwork and color of ink to choose from. I have been printing cards for my ham

friends for some time now and I have been encouraged by my friends

to branch out and advertise a little.

I can print 1000 cards with black ink for only $50.00. Why should you order your cards from me? Because $50.00 is it! No shipping charges, no setup charges, no hidden costs. PLUS...you have your choice of 13 card colors, unlimited artwork, and you can have up to FIVE different layouts per order. Want color ink? For example, do you want a red, white and blue US flag on your cards? That would only be $65.00 per 1000, with 13 card colors to choose from,

up to FIVE different layouts, and unlimited artwork in black or colors.

Your card color choices are white, blue, yellow, pink, green, ivory, peach, gray, and the following eyepopping flourescents: yellow, pink, green, blue, and red. Artwork is too numerous to list all designs here, but just some examples would be an ARRL logo, ARES logo, SKYWARN logo, flags of all 50 states, maps of all 50 states, antennas and radios, flags and maps of US territories and foreign countries and 1000's more...
Custom artwork available at NO ADDITIONAL CHARGE!!! Just tell me what you want!!!

Reply via private email for a FREE sample snail mailed to you today!

To place an order call Mark at (904) 626-2450 or FAX (904)626-7686 or you can mail check or money order to:

I work as a microwave engineer and consequently do a lot of work with
PTFE. I have never found anything to satisfactorily bond teflon; the
trick is to do the design right so that the Teflon part is mechanically
retained, as it is quite soft andholds onto barbed metal parts quite
well.

>

Sure. The network I've described above used the Percom Wireless Bridge 920, which uses frequency-hopping SS on the 900 MHz band. There's also a Wireless Bridge 2400 for the 2.4GHz band. The tranmit power of these units is low; under a half-watt; possibly much less than that. They spec at 2Mbit/sec but in our tests we seemed to be able to transfer files at about one-third to one-half the speed of a 10-Base-T Ethernet LAN. The ranges involved were relatively small; about three miles or so was the longest link path.

Hi Tom,

Sweep tubes used to be cheap tubes. 6146's cost around $8 each wholesale, and sweep tubes were on a buck or two. Cost is always an issue that drive component selection.

The Japanese also used sweep tubes because they make great effort to avoid out of country suppliers. They have great fraternalism and unity in supporting their own workers and countrymen.

6146's also will not work in grounded grid RF amplifier applications. Sweep tubes were the ONLY cheap tube suitable for grounded grid RF applications.

Sweep tubes now cost more than transmitting tubes, so the cost advantages have disappeared. A 572B now costs less than a 6JE6.

The April edition of Ham Radio Online magazine is now available at
http://www.accessone.com/~vbook
or
http://www.accessone.com/~vbook/hronline.htm

This month features original stories on packet radio path quality, spread spectrum
communications, more information on making your own solar observations, getting started in shortwave listening and an amazing list of hidden or not so hidden renditions of Morse code in popular music. We will be adding more stories over the coming weeks - this is a dynamic magazine with upates appearing as often as daily.

As usual, Ham Radio Online also features Amateur radio newsletters from around the world, real-time ionospheric propagation reports, real-time aurora conditions,
real-time MUF calculations, real-time earthquake and severe weather reports and so much more.

Stop and by and enjoy. We are free - and free of ads too - your stories are always
welcome at Ham Radio Online.

Thanks and 73,
Ed and Kim Mitchell,
KF7VY and N7VPL

2107. New Bugging and Surveillance Intelligence

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-03-31 00:00:00 UTC
From: jmatk@tscm.com
Message-ID: <jmatk-3103962151380001@jmatk.tiac.net>
Source record: 106339
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.homebrew,alt.radio.scanner

Update on Microwave Bugging Devices - 3/28/96

0.902 - 0.928 ghz - Popular Commercial FH/DS Devices
1.710 - 1.755 ghz - DEA Audio/Video Bugs (over 1400 bugs purchased in 1995)
1.710 - 1.755 ghz - DOJ Audio/Video Bugs (.25 to .50 watts)
1.710 - 1.850 ghz - Treasury Video Surveillance Systems
2.400 - 2.484 ghz - Popular Commercial FH/DS Devices
4.635 - 4.660 ghz - Treasury Video Surveillance Systems

Most recently purchased gvt microwave surveillance gear seems to be running between 900mhz to 5ghz, with a few systems operating on the 7/8 ghz bands.

Also, keep in mind that the pros love to use ultra low power devices which use the power lines as the transmission medium/antenna (9khz to 300 mhz). Devices typically operate below 10mw, often below 1mw. The devices typically use Wide FM and use voice inversion encryption... VERY easy to demodulate.

Note: According to a recently obtained DOJ surveillance training manual:

�The typical range for the 28 ghz devices is six miles, the typical range of the 2.4 ghz is thirty miles, and the typical range for the 1.7ghz is 44 miles.�

�... frequency modulated applications should operate below 3 ghz to take advantage of the favorable frequency propagation characteristics of that part of the spectrum.�

�...Frequency Hopping and Direct Sequence Devices spead spectrum devices should operate above 1.5 ghz, this will prevent the emissions from being detected by electronic countermeasures.�

>Japanese may have had, why would anyone have wanted to make a sweep
>tube amplifier anyway?

In the 1960s and 70s the sweep tubes were probably cheapest in terms of
$ per watt of plate dissipation, save maybe for surplus 807/1625 types.

According to my RCA tube book the 6LQ6 series specifically states that
it could do 200 watts plate dissipation for some short maximum duration,
15 seconds as I recall. No other sweep tube was specified in this particular
way, nor the 6146. Sweep tubes are usually specified for "pulse" operation.
SSB (particularly uncompressed) has a low duty cycle (not as low as pulse,
but lower than CW/AM/etc.) I don't think the 6146 series ever was spec'd for
pulse operation.

Also most of the larger sweep tubes are rated for about 1KV maximum DC plate
voltage (the 6146B max DC plate voltage is 750). The higher max plate voltage
would make it a bit easier to design a pi-network output section as total
plate impedance would be higher for the sweep tubes for the same power level,
say in a 1kw input type amplifier, and you still wouldn't need to have very
much spacing in the plate tuning capacitor because you're not dealing with
really high voltages like in a 572 or 3-500Z amp.

Nowadays it would be nuts because the sweep tubes are mostly out of production
and remaining stock is expen$ive, particularly if you're going to design
a new amplifier for commercial production.

I think they use a ultraviolet light cured photoelastomer. So it's
really quite similar to making printed circuit boards. I think
Don Lancaster in one of his many magzine columns had some references
to this. (A real effort to dig up, maybe you need to get a trial
account on Genie, where he hangs out.)

Six port network analyzers tend to be fairly narrow band (since they involve
quadrature couplers) and calibration intensive. Their main advantage is the
possibility of extreme accuracy since no phase measurements are necessary
(everything is done with power meters). You probably don't want to try to
use this technique for a poor man's network analyzer.

Several alternative suggestions:

1. You can buy an HP 8410 network analyzer for about a kilobuck +/-. That's
pretty cheap. (I sit across the aisle from one of it's designers).

2. A spectrum analyzer with tracking generator will do scalar 2 port measurements.
You can save money by building your own tracking generator. Spectrum analyzers
are also available used for a kilobuck +/-.

3. You can get 1 port vector measurements with an HP 4815 vector impedance
meter. They also go for a kilobuck +/- used.

Hello,

Can somebody help me on this article in '73 magazine' in march 1991.

March 1991, '73 Magazine' has an article by John Hoots on page 12
with a description of modifications that can be made to some scanners
to improve the I.F. bandwidth.

I live in europe and i'm not able to catch up some articles or buy
one!!

I hope there is someone who will help me on this.

Can someone make a few copy of this article and send it to:

Geert Pirens, ONL2057
Flekeleerstraat 54
B-3600 GENK
BELGIUM

Greatfule thanks!!!!

73!

Geert Pirens, ONL2057

I recently saw the Cassini spacecraft under construction at JPL. NASA learned its umbrella lesson with Gallieo: the Cassini antenna doesn't fold up.

My venerable old 1973 ARRL Handbook, in a section entitled "A Sweep
Tube Linear Amplifier", states, "Because only low-duty-cycle transmission
is suitable for sweep tubes operated at high power levels, this amplifier
cannot be used for a-m, fm, or RTTY service." Aside from problems the
Japanese may have had, why would anyone have wanted to make a sweep
tube amplifier anyway?

Although this may not be the right news group, it seemed to be the likeliest place for this post.
For those of you who may have in days gone by used a test oscilator as a transmitter, or learned how a local transmitter could over-ride an amplifier in a juke box, here's a good "what if" type of question.
Does anybody know of something that will broadcast only 10-20 feet yet over ride an amplifier with a squeel of chirp or something.?
I ask this on part of a couple who can't stand drive by's with loud car stereos.
Personnally I don't notice if they're loud or not. (is that good or bad?)
Like I said in the beginning, this is strickly in theory only for reason of debate and information.

>That said, I step on the slippery slope and state that the generally accepted
>definition of noise figure is noise factor expressed in dB, e.g. a noise
>factor of 2 is a noise figure of 3.01 dB. This is in opposition to Alan's
>usage.
No, I accept that definition. Most formulae for sensitivity just use noise figure but I recently came across the form I gave. This is in "Reference Data for Radio Engineers" in Section 29-8. It uses the following formula.

dBm at input = -198.6 +10*logB + 10*log(Te)
where Te is the effective noise temperature of the receiving system and is given by
Te = Ta + (LF - 1) * To
where Ta = antenna temp., L= line loss factor, F= noise factor and To is ambient temp.
Replace the antenna and line with an ideal signal generator (Ta=0, L=1) and 10*log(Te) becomes 10*log((F-1) * To) or 10*log(F-1) + 10*log(To).
For To=290, dBm at input is now -174 + 10*logB + 10*log(F-1)
It doesn't matter for large noise figures i.e. where noise factor>>1 but consider a noise figure of 0dB (noise factor = 1) This is a noiseless amplifier and thus should have an infinitely small sensitivity which this formula gives. 10*log(1-1) is very small!
So why doesn't the -174 + 10*logB + noise figure give infinite sensitivity for a perfect amplifier (noise figure = 0)?

>letting B = 1 and using the log form, 10*log(kT) = -204 dBw = -174 dBm. Note
>that Alan used -174 for dBw, which is also incorrect.
Oops! you're correct.

Ariel,

Go to an art supply shop and take a look at block printing supplies. You carve your design in to the surface of a block with a rubber-like material on the surface, roll on the ink, and print. You could also use photo etching techniques similar to those used in making printed circuit boards to tranfer your design into the surface of a metal block, and print with that. I've made holiday cards with the block printing technique, and had fun doing it.

Cheers,

Jon

You might also consider silkscreening, especially if you're doing this for the self-satisfaction of printing the cards yourself. It's easy to make a silkscreen frame from wood (I did that when I was 18 with practically no tools), or you can buy various sizes at an art supply.

After you have a frame, the pattern you've designed is transfered onto a sheet of film sold at the art supply for this purpose. Next, the film is affixed to the silk (which is stretched taught in the frame) by wetting it slightly with acetone. The film isn't affected by the inks and it will last practically forever (just remember to clean the exposed silk well after each run). When I did this, I cut the pattern out of the film by hand, but I think the film is also available in a photo-resist version. If you have a CAD program, transferring the pattern should be a snap. Also, if you can print "separations", you can lay down as many colors as you want. After the film is attached to the silk, the cards are printed one at a time by placing the blank stock under the silk and using a type of squeegee to push the ink through the pattern.

Even if you don't want to print the entire card yourself, silkscreening has the advantage that it won't look like a rubber stamp. The ink is thicker and it stands out much better, in addition to being available in thousands of colors. You can also buy ink formulated specifically for glossy stock.

The initial cost for all this is probably slightly less than having cards done at a printshop, at least if you build the frame. Once you have the supplies, you can make as many cards as you want and even change the pattern at very little additional cost. Incidentally, if you didn't know, silkscreening is how many (most?) companies paint the numbers, letters and other markings on the front panels of electronics equipment.

Have fun!

You could probably build a jammer for the entire FM band, but that won't do much to a cassette deck or CD player.

I once had a friend who got so frustrated with people zooming through his neighborhood, making it unsafe for kids to play, that one day he threw a rock through a car's side window.

The driver got out of the car swearing like crazy and started towards the guy, who promptly walked into his garage and reemerged with a 12 gauge. End of argument.

Maybe your neighborhood should consider installing gates to control traffic flow?

It wasn't just the Japanese. I can't count the number of times
we replaced

the sweep tube finals in a Drake T4XB at the Clemson U club station. I think
it also used a pair of 6JS6C's, but I'm probably wrong. When we got a Kenwood
TS530S with 6146B's, even with fairly regular contesting, Dx'ing and general usage,
they kept going and going and going..... Of course, by then the RTTY enthusiasts
had graduated. :-)

My dad's Drake TR-3 transceiver uses three sweep tubes in parallel,
and it does use them on AM, but they pulled a trick to keep the
duty cycle down. They suppressed the carrier and screen-grid-
modulated the tubes so your wattmeter looks like you're talking on
sideband, but when the sidebands are present the carrier is also,
making it possible to copy you on an AM receiver. Of course, a
REAL AMer would tell you you don't sound too good...

This News Release is for your info -- please pass on to all your links
Click on "http://www.nidlink.com/~bobhard/mom.html" at PROTEST.TXT for
further updates
and latest news as I get it from the Freemen in Lewistown, Montana. It
will be updated
as I receive data, at least once per day.

April 1, 1996 5:00PM PST

---- PROTEST IN MONTANA ----

We the people have assembled in Lewistown, Montana to show support
for the Free men here and across the nation.

If you love freedom and liberty come and join us in this effort.

We invite God loving, freedom loving people of all races and
religious beliefs to stand with us for the Constitutional principles
of freedom and justice for all.

Let the courts decide who is right or wrong. Let justice be done by
a FULLY INFORMED JURY OF THEIR PEERS.

The Federal government and it's agents should not be involved in
preemptively deciding who is right or wrong. THAT IS THE RIGHT AND
THE RESPONSIBILITY RESERVED TO THE JURY BY THE CONSTITUTION.

Come and join us. We are in the Kiwanis Park on the west side of
Lewistown. There are several motels, or camp with us. We will be
here until this is resolved. Our numbers are not great at present as
this protest was organized on short notice but more are coming.
People will continue to come and go, but we do need to make a very
positive statement of support for "CONSTITUTIONAL DUE PROCESS OF LAW"
AND OUR CONCERN FOR THE PROTECTION OF THE INALIENABLE, INHERENT RIGHTS
OF ALL INDIVIDUALS INVOLVED.

We are preparing to stay for the duration of the situation.

PUT A WHITE RIBBON ON YOUR ANTENNA. Bring your BIBLE !!!!

!!!--- LEAVE YOUR WEAPONS AT HOME--!!!

!!!--- LET THE JUST POWER OF GOD PREVAIL ---!!!

!!!--- LET US JOIN HANDS, WE CAN DO TOGETHER WHAT WE CANNOT DO ALONE
--!!!

We, the "Freemen of the Northwest", basing our lives and our actions on
God's Law, the Constitution of the United States and the original State

constitutions will not tolerate another Ruby Ridge or Waco and we again urge you to join us. Come stand with us for Freedom and Justice.

PLEASE-- DO NOT SHOW UP IN JORDAN, MONTANA, where the standoff is occurring.

If you are unable to join us in the protest rally in Lewistown, Montana, PLEASE SHOW YOUR CONCERN and INTEREST by calling, faxing, e-mailing or by

US mail to the following agency and offices.

UNITED WE STAND, DIVIDED WE FALL

THE FREEMEN OF THE NORTHWEST

>REAL AMer would tell you you don't sound too good...

Drake calls this "controlled carrier AM". I think what's really happening
is that the carrier level into the finals tracks the modulation envelope,
so when the signal is only lightly modulated (i.e., less power into the
sidebands), the carrier level is reduced accordingly, so that the carrier-
to-peak-modulation-power level is held more in line. It definately gives
you lower average plate dissipation (unless you're also using audio
compression) and it is still audiable on a regular AM receiver (altho the
RF-derived "S" meter on an old style AM receiver will now move at a syllabic
rate, rather than hold steady). It's kind of an interesting scheme and the
only drawback I can see is that the receiving end might perceive a lower
signal/noise ratio during periods of low modulation.

No other HF transceiver (even modern solid state ones) seem to work this way.

2138. Radio Telemetry Module?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-02 00:00:00 UTC
From: mkudra@cris.com
Message-ID: <4jsba1$j60_001@news.cris.com>
Source record: 106280

We are searching for a module or small board to provide real-time telemtry transmissions from high-powered model rockets.

This unit would need to be:

a) Licensed or legitimately usable unlicensed in several countries,
b) Interfaceable to an altimeter/accelerometer CPU,
c) capable of transmissions to a range of 50K feet.

Any leads will be greatly appreciated.

BTW, we are not 'radio-knowledgeable' people, so if there is a more suitable newsgroup to target, please let us know.

Thanks,
Malcolm

2140. Valve amp/masthead amp design

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-02 00:00:00 UTC
From: Steve Clements <steve.clements@amigabee.posnet.co.uk>
Message-ID: <9604030320061011@amigabee.posnet.co.uk>
Source record: 106282

Hi,

I am after info on stuff. I plan to build a valve amp, some DJ9BV's (wrong
newsgroup sorta) and a mebbe a masthead pre-amp.

All the below is intended for 50, 144, and 432MHz.

I have had a few comments from packet radio, but things raised there are
still not clear to me.

Amp.

I have a transformer stated 1250-0-1250 @ 310mA. I'm told this will be
enough to run 2 x 4CX250's, but the current for one seems to disagree with
that (valve info from packet net)

Will 1250-0-1250 @ 310mA be enough for 2 4CX250's, at about 400W output
?

Or what output could I expect ?

I was hoping to use 250's as they are common. But if you say, "Hey, use
this tube, its cheaper than a pair of 250's, and easier to build around"
then I'm listening :-)

Also I have this idea.It must be duff, coz never heard of it, but here
goes..

Example: twin 4CX250 amp.

You build your HT PSU, and valve enclosure etc to make your 144 amp. It
has a U shaped matching thingy connecting the valves (techy huh ?) and no
doubt a cap and coil or two about the place.

Could the amp no be designed in such a way to swap the freq dependent bits
and use same expensive bits on another band ? I'm talking a few times a
year rather than very often...

I've been told things like "watch the RF switching timing" (also refering
to mast-head) I guess this would be covered in the amp design, but am a
bit concerned about the masthead, as I am not 100% about that.

I'd also be grateful for specific articles that describe fully (fit part a

to part b..) the building of suitable amp/amps. I have checked out the latest ARRL handbook, and it seems to have dropped the "old faithful" type
designs, on the presumption you have past issues I guess. I dont.

A QST, VHF Communication, DUBUS etc issue number (and maybe even source) would be great !

Masthead amp.

We are using an ERA1 gaAsfet at work for an amp on 750 to 2050MHz. This little BUGger does DC to 8GHz, and is flat as anything in that band. He only has 11 dB gain, but his mate ERA3 has 26, and a noise fig of about 4
or 5 methinks. Most importantly, he is CHEAP BIG TIME !! (2) And he works
with nowt but some DC shoved up him.
It occurs to me that he might be slid in between 2 coax relays, and poked
on top of my mast, to make a masthead for 50,144 AND 432 in one box.
I'm not after the worlds most sensitive and silent amp, but something that
is better than an amplifier integral pre-amp type.

Any reason why not that you clued up guys know ??

I planned to use a direct drive to switch the masthead relays over on TX,
coming directly from the mic PTT switch. Could this method be used to over
come this timing biz/RF on swithover time etc thingy ??

Oh, I also have an aging Kenwood TR-7010 crystal controlled SSB rig.
Anyone know what they perform like, and know of a site/sites for mods if they need them ???
I'm mainly after nearby BIG signal rejection, and a bit of sensitivity as
well.(Sensitivity comes second tho ! I need NOT to hear close BIG stations
on the whole 2megs of 2m !! One contest group /P + another contest group
/P @ 10km = good RX - NOT !)

I'm mainly into VHF contesting at the mo, but it occurs to me that the same kit to be a big noise (hence amp and 4xDJ9BV's) would give me a sporting chance on EME. You reckon mast head described, if works, be any good for EME ??

Direct email welcome, I think my address has changed on 1 April, should now be:

Steve.Clements@amigabee.qnet.org.uk

Cheers de Steve !

2143. Identity of the mystery coax and the invention of Gore-Tex!

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-02 00:00:00 UTC
From: acj@ultranet.com
Message-ID: <acj-0104962208430001@amber1.ultranet.com>
Source record: 106366
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.components

I posted a discription of some unusual coax a couple of weeks ago, hoping that someone out there might be able to identify it. I just discovered what it is, and thought some of those who responded might be interested. Here the description I posted originally:

> >I have some high quality double-shielded Teflon dielectric coax for which
> >I would like to get some precision N connectors. The coax is unmarked
> >however, and the connector suppliers I've contacted tell me they need a UG
> >number or other identifier inorder to provide the correct connector. Can
> >anyone help identify this cable? The outer sheath is a very slick plastic
> >(HMW polyethelene?), lavender in color, about 0.275" diameter. The
> >silver-plated braided shield beneath is about 0.190 diameter, and is
> >separated from the spiral wound flat inner shield (O.D. 0.150") by a thin
> >layer of wrapped teflon. The stranded central conductor, inside more
> >wrapped teflon, is silver-plated, 0.056" O.D. (15 guage), and contains 19
> >28 or 29 gauge strands.

It turns out that this is a proprietary cable made by W. L. Gore: the lavender outer sheath is their trademark. The insulation is not merely teflon as I thought, it is actually Gore-Tex. Yes folks, these are the guys who invented Gore-Tex, and it was developed as a dielectric for microwave coax. The water proof, breathable fabric for clothing was an unexpected alternate use. At the time Gore-Tex was developed, cables were their only product. Their catalog claims two major advantages of Gore-Tex over teflon: Gore_Tex is 70% air and thus has a dielectric constant of 1.4 compared to 2.1 for teflon. This allows use of a center conductor with about twice the surface area/unit length as compared with a teflon cable of the same diameter. This decreases insertion loss. Second, Gore-Tex has a loss tangent 10-fold less that of teflon. (I don't know precisely what a loss tangent is, but I'm sure bigger isn't better.) The spiral wound wrapped shield is the actual electrical shield, while the braded shield is primarily mechanical. The spirals of the inner shield are overlapped slightly, and the overlapped portions slide over each other as the cable bends to maintain good shielding (leakage less than -90 dB).

Now that I've found all this out, I still haven't solved my original problem: how to add N-connectors to this stuff. Gore doesn't sell either the cable or connectors: they only sell assembled cables. I got the two ends I want to add the connectors to by cutting one of these. Since I can't find standard connectors that fit this stuff, I'm going to try a little machining to modify some. I don't expect to get the VSWR of 1.25 typical for these cables @ 18 GHz, but if I can do as well as that at 2 GHz, I'll be reasonably satisfied.

Cheers,

Jon

(I sure hope I got this constrained to AMD only!)

If you're a ham and you work at AMD, please read this!

We're starting an amateur radio club at AMD Austin. If you're in Austin, send me (or Curtis.Doss) e-mail for more info. We're just getting organized to ask AMD for space and support, so your interest is important.

If you're not in Austin, we'd like to know about any non-Austin AMD ham clubs (or hams, for that matter).

2155. QEX Delivery Problems

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-02 00:00:00 UTC
From: stevem@w6yx.stanford.edu
Message-ID: <4jrrm2$is6@nntp.Stanford.EDU>
Source record: 106378

Its April 2 and I received my January issue of QEX in the mail
today. The QEX circulation department does not seem to want to
answer their Email so I am wondering if other subscribers are
still having these late delivery problems.

I remember a thread on this a few months ago and someone saying
these problems were being taken care of and should be fixed soon.
What happened?

>George
>KC2MF
>sereikas@worldnet.att.net
>
>
Starting about 15 years ago the us federal gov required that they,
the meters be removed before being released for sale. The meters have
radium on the needle and meter face and are quite "hot"(radioactive).
While I suspect that the level is less than a 1950 watch or clock face,
we must be protected. I had a R392, kind of the mobile version of the
R390, and was amazed that the meter would "peg" my old civil defense
gieger counter. Have you tried Fair Radio Sales in Lima Oh?(I would
have given the address/phone number but my catalog has "vanished")
I traded away my R392 and have recently regretted it. Bu. we can't hang
on to everything. Of course our cat sure liked the R392 much more than
the Kenwood R2000 that replace it. The R392 got nice and hot. And the
cat like to sleep on top of it.
Good luck.

: I'm building a HF-PA with three 813's in grounded grid but I
: would like to try the G2DAF grid-driven design instead. Has
: anybody compared efficiency and linearity between those circuits?
: - SM5DFF

The novelty of the G2DAF design was in using the incoming RF to power the screen grid supply. The grounded cathode configuration gives somewhat more gain than grounded grid, but the screen supply keeps the drive power requirement up. It is difficult to find seniconductor diodes that are fast enough to work well in this circuit at the necessary voltage ratings. The original used thermionic rectifier valves.

With a 100Watt exciter, I'd suggest the grounded grid for its good linearity and freedom from neutralising/decoupling difficulties. Grounded grid passes exciter power to the load and so might just be noticably more efficient...

Cheers

>Ken Burtchaell <kburt@telis.org> wrote:

>>I am looking for a method to simulate plated thru holes in thin(.010
>>duroid).This is for small quanity work,one of a kind boards for amateur
>>microwave projects.

There is an outfit in Santa Barbara CA (and it has only been thirty
years since I bought my last batch of 10,000 from them, so their name
escapes me for the moment -- "Electronic Rivets", "Electronic
Eyelets", or something like that) that make little teeny tiny soft
hollow copper rivets that come in all lengths from 0.010 to 0.250.
They are VERY thin (0.002 or 0.005) so you simply insert them into a
hole drilled .005 or .010 oversize and then splay them with an icepick
or something like that. If it is a component hole, you solder the
component into one side and it will suck up and solder the other side.
If it is a via, you solder them directly.

I really hope somebody will come on and tell you the name of the
outfit. I've used my supply for YEARS now.

I am looking to build a receiver for detecting RF from Jupiter.
The range must cover 18Mhz - 22Mhz. I'd like to be able to tune in
500Khz increments. The output will be directed to a 12-bit A/D for
sampling. Any information, books to refer to, or existing schematics
would greatly be appreciated. Keep in mind that I do not have an
extensive RF design background.

And not only that, the circuit is horribly non-linear! It is probably the single most IMD prone circuit in history.

The scrren voltage fluctiates wildly with drive, the screen grid loads the input RF envelope at a non-linear rate with power, and so on. It ranks right up there with class C amplifiers for SSB purity!

> With a 100Watt exciter, I'd suggest the grounded grid for its good >linearity and freedom from neutralising/decoupling difficulties. Grounded >grid passes exciter power to the load and so might just be noticably more >efficient...

I'll vote for that! There is no merit in using grid driven circuits unless you need the gain. Grid driven circuits are more complex (expensive) and harder to stabilize. They are also more critical for voltage regulation, and harder to tune!

Use grounded grid! Does the 813 have the beam forming plates brought out on a seperate connection? If so, it'll work. If the beam forming plates are tied to the heater it won't work in grounded grid.

From: lion@tigger.jvnc.net
Message-ID: <DpAryA.MwF@tigger.jvnc.net>
Source record: 106297

Hello:
Name here is Kelly. I am currently builind an RS-232 interface for my ICOM 736 radio. I will use this to control my rig from my computer instead of the CI-V converter box ICOM sells. I got the plans from compuserve, and the total cost (not counting the stuff from my junk drawer) was about $5.00. All parts except the power supply are available from Radio Shack.

Anyway, I would like more information on the command structure used by ICOM. I have a brief document from compuserve, but I am sure it does not contain ALL of the interface commands. If nothing else, I guess I'll have to by the book from ICOM for $15. I fully understand the commands I have information on, but would like to know if there are any addional commands.

Thanks in advance,
73 de Kelly

I'm just guessing, but I don't think it's so much a delivery,
as a publication, problem. Our copies are probably mailed
out immediately upon publication. It reminds me of some iron
curtain math journals some years ago. They would publish only
as material, press time, and paper became available. LIke in
this morning's mail I would get an issue with a "publication date"
of "July 1994".

Let's be patient. Circulation might just handle things like billing.
You'll probably get a friendly reply if you write or call Lori Weinberg.

Jon Goguen (acj@ultranet.com) wrote:

: It turns out that this is a proprietary cable made by W. L. Gore: the
: lavender outer sheath is their trademark. The insulation is not merely
: teflon as I thought, it is actually Gore-Tex. Yes folks, these are the
: guys who invented Gore-Tex, and it was developed as a dielectric for
: microwave coax. The water proof, breathable fabric for clothing was an
: unexpected alternate use. At the time Gore-Tex was developed, cables were
: their only product. Their catalog claims two major advantages of Gore-Tex
: over teflon: Gore_Tex is 70% air and thus has a dielectric constant of 1.4
: compared to 2.1 for teflon. This allows use of a center conductor with
: about twice the surface area/unit length as compared with a teflon cable
: of the same diameter. This decreases insertion loss. Second, Gore-Tex
: has a loss tangent 10-fold less that of teflon. (I don't know precisely
: what a loss tangent is, but I'm sure bigger isn't better.) The spiral
: wound wrapped shield is the actual electrical shield, while the braded
: shield is primarily mechanical. The spirals of the inner shield are
: overlapped slightly, and the overlapped portions slide over each other as
: the cable bends to maintain good shielding (leakage less than -90 dB).

The insulation IS merely teflon, in the strictest sense of the word!
Goretex is just expanded polytetrefluoroethylene (or teflon for short).
All that is in the cables insulation is teflon and air; nothing else.
The reason why the dielectric constant is lower, and the loss tangent is
higher, is that the insulator is mostly air. We use the cables you refer
to here extensively (with good results), but they ain't exactly cheap!
I have also worked extensively with Goretex sheet (1mm thick), used as a
semipermiable membrane in a hydrostatic pressure sensor, The stuff is
really fascinating to work with.

Bob.

>tube amplifier anyway?
>
>Tom Donaly KA6RUH

Because TV sweep tubes have humongous cathode emission levels -- ie, even tho the plate dissapation might be only 25 watts in ICAS, the tube's cathode might well be able to supply enough current to allow for peak power levels of well over 100W per tube.

As a result, if you were producing a final which was going to be used in a [relatively] compact unit, you could get your power density waaaay up there, compared to how much space it would have taken you if you were using "real" tubes for the job.

Look at the Swan line of transceivers -- they used sweep tubes and were very popular for mobile SSB work in the late 70's and early 80's.

So what if the key-down power level was only 15% of what the SSB rating was? Were you really going to use it for CW? RTTY? How many people used to work RTTY when you were using 026's and model 19's? FM? On HF? Nah. AM was well on its way out the door by the late 70's, so sweep tubes were a pretty nifty idea on how to get SSB equipment down to a tolerable size for mobile work. In that era, SSB was "the thing" in commercial equipment.

Transmitters I've owned (or still own) which use sweep tubes:

- Hammarlund HX-50 (6DQ5) (not exactly a mobile unit)
- Swan 260, 270, 500 (very usable for mobile work, and I used the 260 for mobile work *very* well during college)

So sweep tubes have their uses. You just have to understand that they're while they're cheap, small and high-output, they don't forgive key-down applications.

Hi!

I want to use a transverter to go from HF to 70cm and get 432 to 438 MHz in one step. This requires my HF-rig to be able to operate in TX from 24 MHz to 30 MHz continousely. Is there anybody who knows how this can be done? I've seen many mods for ICOM-rig's but none for the 737. HELP!!

Good idea! I guess the temporary absence of the 811A from the market still tends to displace it as a choice for transmitters. I don't usually think about using it as a grid-driven final, although there's no reason not to.

At 100 watts out, an 811A would last almost forever. It's also cheaper than a pair of 6146B's.

Source record: 106317

Someone asked again about QEX. I got my January issue earlier this week, too. It reminded me that I didn't know when my subscription expires.

I e-mailed to circulation and got a *very* prompt reply from Kathy C. She said that, yes, they are still a little behind on getting the magazine out.

The way I figure it, they are 3 months behind and they have been since about October. HOWEVER, I have been receiving a new issue about once a month since November or December (I forget). This means they need to cut about a week off the turn around time to start to get caught up.

Again, my guess is that this is basically Jon, the editor, and one or 2 other people putting together QEX for us. It doesn't take much, like the editor being *really* sick or some such to really mess wtih the schedule.

For my part, Jon and his group do a fine job of putting out a quality magazine. The biggest problem for me is the withdrawal from not getting QEX. I intend to be patient and not bother them too much while they continue to dig themselves out of this hole.

2192. 70 cm Transverter recommendations needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-04 00:00:00 UTC
From: P06288@email.mot.com
Message-ID: <1996Apr4.151830.969@schbbs.mot.com>
Source record: 106319

I have a Yaesu FTV-107 dual transverter box which contains only the 2 M module. I would like to add the 70 cm band module but have been unable to find anyone willing to part with theirs. As a result I am considering building my own module using commercial modules, PCBs, or whatever that already exist and substitute my own module in place of the YASEU module.

Can anyone give me some recommendations on modules, PCB's etc that use the standard 28 mhz as the local osc and switchable IF?

You can email me at gerwitz@getnet.com.

Thanks

Jim

>I was hoping to use 250's as they are common. But if you say, "Hey, use
>this tube, its cheaper than a pair of 250's, and easier to build around"
>then I'm listening :-)

There is a guy here Karl Wiener, who designs amplifiers around some russian
tubes and he says that they are sturdy and cheap.

>I'd also be grateful for specific articles that describe fully (fit part
>a to part b..) the building of suitable amp/amps.

Get the VHF-DX book by Ian G3SEK, it will tell you a lot about assembling
a good station. Also DUBUS publishes technical notes (Rainer DJ9BV).

>It occurs to me that he might be slid in between 2 coax relays, and poked
>on top of my mast, to make a masthead for 50,144 AND 432 in one box.

Such a thing would completely overload from broadcast and TV.

>You reckon mast head described, if works, be any
>good for EME ??

You would soon learn to appreciate a state-of-the art no-compromize
preamp.

There are a few mailing lists related to VHF and EME, where knowledgeble
people ca be found.

From: Monty Wilson <mwilson@bangate.compaq.com>
Message-ID: <DpCtAy.3vp@twisto.eng.hou.compaq.com>
Source record: 106324

AMers:

Call me unamerican, but I like my no-tune transistor rig. Right now I'm running a Yaesu FT747 which even has a fair AM receiver in it.

Unfortunately the AM transmitter is low-level modulated of course.

I know a lot of "real AMers" have built plate-modulated transmitters. I know because I've heard the wonderful signals from your stations. I only run AM on 10m; it's my favorite band for just about everything including spreading out above 29 MHz and having fun talking to all you guys that have built your own equipment with nuvistors in the front end, etc. As soon as the spots come back, we'll talk again on 10 meters.

What I want to know is: has anyone managed to take a late-model solid state transceiver (like mine) and modify it to run collector- modulated AM? Other than finding or winding a modulation transformer, it would seem relatively simple to modify a solid-state rig like this, and you could run a 40W carrier, which on 10m would be plenty.

Has anyone tried this?

I figure I have a few years to work on this one, until the sunspots come back from the dead.

Check the price of replacement finals before you try this. The peak
Vcc that results from collector modulation may exceed their ratings.

Message-ID: <emeb-0404962043490001@s169.phxslip4.indirect.com>
Source record: 106328

Hello,

I've recently become interested in 6m operation, and have started a small project to build a 6m FM Transceiver. I'm basing the whole thing on a bunch of Motorola parts which were originally intended for cordless phones.

I started with the reciever, based on an MC3362 Dual Conversion FM reciever. It looks pretty good on paper, and overall it works pretty well. I use an MC145162 PLL chip to lock the first LO, and the 10.245 2nd LO as the input to the reference divider.

As it stands right now, the thing has a sensitivity of about -100 dBm. This is about 20 dB off of what it should be able to do, and I think I know why: Looking at the 1st LO on a spectrum analyzer, it is REALLY messy. I have tried all the common solutions to phase noise in PLLs - wider loop bandwidth, regulation of the Phase Detector and VCO supplies, boosting the VCO output levels into the feedback divider, but no improvments yet.

So, anyone have any ideas on other things to do to clean up that LO?

Advice appreciated.

Source record: 106230

Sorry if this is a repeating question, if it is, then flame me by e-mail, I'm new here.

I want to find a way to use a PC printer to print directly on printed circuit board raw stock for the purpose of making quantity 1 or two boards. Is there a printer not expensive (read <$600) that can do that? I don't want to mess with several photo steps if I can eliminate that.

Maybe a straight paper path printer would work if raw stock was thin enough. I have found two printers with almost straight paper paths, one is a HP ink jet, the other is a Citizen portable thermal wax transfer. But I'm not limited to these, I haven't bought yet. I have found .007 double sided 1 oz. stock.

I have tried the laser printing to paper then use a hot iron to transfer ink to PCB from DIGIKEY. Much of the ink fell off of the PCB and the heat from the iron oxidated the copper.

Can I print directly on to a sheet of copper then glue it to PCB and then etch that? What glue withstands soldering heat?

Thanks - All responses appreciated - All the best
Mike Colley

If you *really* want to use an FT-747 like this, I'd suggest using the
radio as a low level exciter to feed a class-C amplifier chain with
high level modulation. For the FT-747, you can get a low level output
from the main PCB where the PA coax normally plugs in, and run the
radio in split mode, CW on transmit / AM on receive.

Hi Mike: I do a fair amount of onesy twoesy pcb boards.
Most of my boards are very simple because they are one or two stage microwave amps.
Somewhere in the newsgroups presently there is a lengthy article about numerous methods that you should read.
I print my artwork on a Okidata laser printer.If you print to ordinary printer paper you will have difficulty cleaning all the paper off after ironing on without losing some of the trace.The board should be ultra clean before ironing,Pre-etching the board surface seems to help.There are better papers to print on.I have been experimenting with a baking pan liner paper sold by rolls in grocery stores that works very well.You iron your print on the board,cool the board and peel the paper right off cleanly.There is another kind of bakery paper which is a sugar base that I understand will disolve in water after ironing.I haven't found any to tyr yet! 73 Ken

Hmmm, this is an interesting approach. You need an eight channel
radio with a channel bandwidth of 500 kHz. Ordinary SW and amateur
radio receivers won't do since, while they'll tune the range, they
don't have the necessary IF bandwidth. A direct conversion receiver
seems the most logical approach, but you need a way to deal with
the image. You might start with one of Rick Campbell's R2 designs
and replace the opamp circuits with a pair of A/D converters on the
I and Q channels, and use a DSP to do the Hilbert Transform to get
single signal reception. A bank of eight crystals could be diode
switched in a Pierce circuit to get the LO, or you could use a DDS.
Either could be digitally controlled so that your data acquisition
system could "scan" the channels.

Since you only need 8 channels, you could forego the digital magic
and just diode switch 8 front end filters in gang with the crystal
switching to get single signal operation, but the constraints on
the filters would be rather strict if you wanted good image rejection.
Because you're going to digital baseband anyway, you might as well
plan on doing the single signal selectivity there as well. Your A/D
better flash at 2 MHz or faster to get well above the Nyquist limit.
That's going to put a bit of strain on the DSP chip, but there are a
few out there that can hack it if they only need to do a Hilbert
Transform on one stream and a multiplication with the other stream.

12-bits won't be enough dynamic range, however, and you're going to
have to use a digitally controlled attenuator in front of the receiver,
driven by a digitally derived AGC, to keep the signals of interest
centered in the dynamic range of the system. That may be a killer
constraint since there will be a number of strong narrowband signals
in each of the channels you'll be monitoring, and they likely will
drive the AGC down so much that the broadband emissions of Jupiter
may be pushed into the receiver noise floor. Perhaps you should
consider cascading A/D converters to give you 24-bit dynamics. Then
you won't need AGC. That'll sure limit your DSP options, however.

The only alternative, and the conventional method, would be to sweep a narrow band receiver across the channel and build up a composite of the 500 kHz channel with post processing. The downside of this is that you won't preserve coherency across the channel, so you'll be limited to recording statistical noise power.

The sound quality from a low-level modulated transmitter should be the same as that from a high-level modulated one, the only difference is that the power amplifier is not as efficient. Maybe there are harsh audio filters/processors intended for SSB use still in the audio path. Or maybe the problem is that you are telling the hard-core AMers that you are using a modern radio, and they just expect it to sound bad.

Direct modulation could be done by disconnecting the collector supply to the finals and connecting it to a source of high-power audio, such as a voltage follower. I wouldn't use a choke or transformer as that may allow the voltage to go too high or swing negative, which is likely to damage the finals. If the peak modulated voltage is 13.8V, there'll be no undue stress on the finals, but you'll still get 100 W PEP (25 W carrier). If you want/need more power, an external amplifier is the only way to get it safely.

Strange things may happen during the negative peaks when the bases of the finals still have high RF drive applied, but no collector voltage. I don't know if this has the potential to cause damage or not.

There was considerable discussion about this last summer. As I remember,
the conclusion was that the 6146W was a military-grade version of the
6146A, having a 25W plate dissipation rating. Therefore the 6146B, with
a 35W rating, was considered superior for most uses.

>
>i'm very new to this amateur radio thing. tell me what i would need to
>reach a 10 mile radius. including amps, antenna, etc.

You can do it with a milliwatt or so of VHF/UHF energy (though boosting that to a watt would give you lots of margin) if the antenna is high enough. To cover a 10 mile radius service area, your antenna needs to be at least 300 feet above average terrain (called HAAT). Higher would be better if the local terrain is rough.

The other option is to use medium wave (160m) and try for ground wave coverage out to 10 miles. For a grade A signal contour, you'll need a vertical antenna about 133 feet tall over a good radial ground field, and an output power of about 1 kilowatt. You might get a 10 mile grade B contour with only 100 watts.

Filling a 10 mile radius is an awkward job. You need lots of height at VHF/UHF to pull it off, though power requirements are very modest. And at MW you need lots of power to get a good contour, due to the propagation path along the lossy Earth/Air interface, and the antenna is just plain big. If you were to say that you wanted a 300 or 3000 mile radius now, that would be easier. You could do that with a few milliwatts on HF using ionospheric propagation (the ionosphere is a very low loss propagation medium if you work near the MUF). But there would be a "dead band", or skip zone, stretching from near the transmitter to near the receiver where little or no signal would be received (or multiple skip zones for the latter distance). Back scatter can fill in some of those skip zones, but then you're back to needing a bunch of power.

That leads to a third option called NVIS, or Near Vertical Incidence Skywave. This would involve firing a lower HF (80m) signal almost straight up toward the ionosphere and filling the service area with backscatter. 100 watts and a (very) low dipole will do for this, and will give reasonable signal fill out to a 75-100 mile radius during some times of the day. It won't work all the time, however, because D layer absorption will eat your signal at midday.

Now if you don't insist on a grade A coverage area with a radius of 10 miles, and don't demand 7x24 service, but instead just want to work some stations at a distance of 10 miles from time to time, then the situation changes radically. You can put up with holes in the service area, you can use low antennas, and you can take advantage of favorable terrain. In that case, a 45 watt VHF/UHF mobile rig will work, or even a 5 watt HT will often serve given favorable terrain, or a modest 100 watt HF station operating on any of the HF bands will work at selected times of the day.

All of these latter options will have holes in their coverage area, won't offer a solid 10 mile radius contour, but will certainly suffice to make a large number of contacts with other amateurs inside (and outside, often *way* outside) the 10 mile radius. Unless you're planning a repeater, worrying about service contours isn't something most amateurs do. Most amateurs are content to reach some stations at some distances on a fairly consistent basis. That doesn't take elaborate equipment, high power, or monster antennas in most cases. And if you're in the footprint of a good repeater, then you may find a HT will give you a 60 mile radius contour (because all the hard work has been done by the repeater, well situated on a very high site).

The MC3362 isn't all that sensitive by itself - around -100dBm if I
recall correctly. If you want more sensitivity, you'll need to
add a pre-amp, but keep in mind the MC3362 mixer isn't all that strong.

Increasing the loop bandwidth can reduce the close-in phase noise
of the VCO if your reference oscillator is clean enough, but the
trade-off is that you'll probably see increased reference sideband
levels. I'd suggest keeping the loop bandwidth below 50Hz and the
damoing around .6 - .8.

If the regulator used for the VCO and PD supply is very noisy, that
will show up in the output spectrum.

The loop divider in the MC145162 only requires a volt of so of
p-p amplitude, I doubt this is your problem..

>So, anyone have any ideas on other things to do to clean up that LO?

To begin with, the LO not be your problem at all. Check your input
match to the MC3362 - you might be able to pick up 10dB here if you're
not properly matched to the Rp=660 + Cp = 7.2pF input impedance
specified in the data sheet. A balun wound on a ferrite core would
probably do the trick here. Also, to get a sensitivity better
than -107 dBm, you'll probably need a pre-amp.

If the VCO really is problem, the best thing you can do is make
sure the VCO tank Q is as good as possible and then use only the
minimum necessary VCO gain to maintain lock over the desired tuning
range under the intended range of operating conditions.

>to modify a solid-state rig like this, and you could run
>a 40W carrier, which on 10m would be plenty.

You can do this, but there are a few gotchas. The final of
a 100 watt solid state rig may draw 20 amps, modulation
transformers aren't the way to go here. What you can do is
use a big honking AF power transistor in series with the
collector lead. Bias it so you get about 40 watts carrier
under full RF drive, then modulate it so that the voltage
swings from near zero to near full supply in step with the
audio drive.

The main gotcha is that the PA likely won't modulate very linearly
treated this way. Adjust audio drive using a modulation monitor for
best symmetric modulation. This may be somewhat less than 100%,
particularly on negative peaks.

If you want to get clever, envelope demodulate the AM signal and
use that as a negative feedback to the modulator. This will linearize
the modulation nicely if done properly.

The other gotchas are the usual, watch PA dissipation limits, and
watch PA PEP voltage. A "100 watt" SSB PA isn't really 100 watts
when you poke a constant carrier through it. Depending on PA
design, it may be common base, in that case you have to modulate
the driver too in order to get 100% modulation.

There's really nothing wrong with low level AM modulation, as long
as the PA has low IMD. You can get just as good a signal quality
with low level modulation and linear amplification as you can with
plate modulation, efficiency just isn't as good. We low level modulate
broadcast TV transmitters, and we have much more stringent signal
quality requirements to meet than does AM voice.

My two cents on sweep tubes. I bought a Drake TR4C back in 1975. It uses 3 (if I remember right, as my dad has the radio now) 6JG6's that have a 300 watt PEP input rating. Some time in the last 20 years I bought a new set of finals. Only thing is that they never needed to be replaced! I used the radio for years, and now my dad uses the radio at least two hours a week (as I talk to him at least that long every week on 20m). The old sweep tubes just keep on trucking (although we both used a small fan mounted over the finals). Drake reason for using 6JG6's :they wanted a lower profile rig, which was not possiable with the 6146's. I still wish it had 6146's though!

When collector modulating a solid state amplifier, the following conditions must be met:

1.) The driver must also be modulated. This is because driver power "leaks" directly through the PA to the output. Unless the drive power is also modulated the correct amount, you won't be able to get more than 80 or 90 percent modulation.

2.) The PA and driver must be class C. If a stage is operating in a linear mode, it will be impossible to modulate it without severe distortion.

Without meeting these requirements, a solid state PA can not be correctly collector modulated no matter what components are used. You can bet meeting this criteria isn't easy.

I think someone else hit it right on the head. If you want to high level modulate, plug in a stage designed to do that. You'll gain 30 percent collector efficiency, and it won't sound a bit better than proper low level modulation.

Perhaps I can help with my experiance of 2 to 6M design,

>>I started with the reciever, based on an MC3362 Dual Conversion FM reciever.
>>It looks pretty good on paper, and overall it works pretty well. I use an
>>MC145162 PLL chip to lock the first LO, and the 10.245 2nd LO as the input
>>to the reference divider.

In my designs I use an MC3371, this device provides IF amplification
squelch and S meter outputs. For the front end I use a dual gate
mosfet (actually has too much gain and had to be biased to a lower
gain for 6M operation to give sensible S meter response), the mixer
was a simple junction FET with LO injected into the source feeding
four poles of crystal filter and then on to the IF chip.

>Increasing the loop bandwidth can reduce the close-in phase noise
>of the VCO if your reference oscillator is clean enough, but the
>trade-off is that you'll probably see increased reference sideband
>levels. I'd suggest keeping the loop bandwidth below 50Hz and the
>damoing around .6 - .8.

I found it very hard to eliminate spurious noise from the VCO when
using the Motorola synth. chips, but turning to the Philips TSA1057
made the loop filter very simple and very little reference frequency
gets through to the VCO.

For info. on how I did it follow the HTML text on my WWW page
html://homepages.enterprise.net/hamlab/ for the piccolo transciever.

Hi,

I have a 22 MHz crystall and I want to pull it up in frequency.
Ideally 1000ppm (0.1%) but barring that I want get as close as
possible to this higher value. The stability of the oscillator
is not important.

I'm assuming it's a series resonant crystall and I'm
speculating that if I put a capacitor in series with the
crystall it's resonant frequency will increase.

I wonder if I'm on the right track and I'm fishing for a
ballpark value on the capacitor I have to insert.

Thanks,
John

Unless you're just into experimenting, I can't imagine why you would want to do this at all.

You can purchase a decent AM transmitter for a few hundred dollars or less, and spend your time restoring it and getting it going.

Or, you can run most modern rigs on AM and still have an excellent signal. Most sandbox radios sound bad on AM not because they "just do", but because they are improperly adjusted -- usually too much carrier output (leaving insufficient headroom to develop the required PEP at about 4 times the carrier power without distortion in the finals) and WAAAAY to much audio drive. There are many fine sounding legal limit AM stations operating in the AM windows which start life as modern transceivers, properly adjusted. And they are indistinguishable from the plate modulated guys (like me).

I think I would forget the 813s and go with a 4CX800A from Svetlana and swamp the grid with a 50 ohm resistor. Really simple circuit. Relatively low plate voltage requirement, good gain, neutralization not required etc. If you can run higher power in SM land than 800 watts of plate dissipation would allow try the 4CX1600B. These two tubes are quite inexpensive.

Hello all,

I am thinking of putting together a portable packet station for field and/or emergency work. One source of power would of course be rechargeable batteries. However, I also thought one might be able to use solar panels to help run the radio (13.5 DCV, 1200 mAhr),a laptop (12 DCV, 1.7A, and a TNC (6-25 DCV, <40 ma).

Does anyone know of a place that sells solar panels? I have found a few but they appear a bit high. On the other hand this is my first attempt so all the help would be welcomed. Thank you

Sorry, I don't have any suggestions to your questions but do hope someone does and look forward to reading them.

I have been seeking some info along these lines, though. I once read an article (maybe ad?) about a process for producing multi-layer boards using conductive ink and, I believe, mylar sheets. The idea was to print them out and then laminate them together. I seem to remember the company or process was called "Green something or other". Does anyone have any information related to this process?

Thanks,

Norman

I think you are confusing sensitivity and signal-to-noise ratio (SNR). Your system with a "perfect" amplifier does not have infinite sensitivity. The 0 dB noise figure simply means that the amplifier delivers the same SNR at its output as appears at its input. If the noise limited SNR at the input is -20 dB, it's still -20 dB at the output. Can you use an SNR of -20dB? If so, you can communicate. Otherwise, your "perfect" (or any other) amplifier doesn't help much does it?

Using your assumption of a series calibration frequency, it is unlikely that you can move it up 22 KHz. Using the series capacitor, the crystal is used in an inductive mode. It will appear inductive between the series resonance and anti-resonance frequencies. Without knowing more about the crystal, it is impossible to know this separation, however, it is very doubtful that it exceeds 3 to 5 KHz.

Forget about doing anything which materially affects the series resonant frequency of the crystal. No can do!
If the 22 MHz frrequency is truly the crystal's SERIES resonant frequency, then you can probably hit the higher frequency by operating the crystal in a circuit which runs at PARALLEL resonance.

Get a CMOS inverter, like the 74HCU04 (should be an unbuffered part, hence the "U"). Put a 100K (not critical at all) resistor from output to input of one of the inverters. This will bias the output to 1/2 Vcc. Put the crystal from output to input. Put a 33Pf cap from input to ground, and another from output to ground. The circuit should oscillate at the crystal's parallel resonant frequency. Adjust the capacitor at the input of the inverter to "pull" the oscillation frequency.

Does anyone know of a chemical method for silver plating PCBs? I currently use silver paint but find that this can be a bit of a pain if the area to be coated is large or the tracks are thin/close together. I know that there is a chemical method for applying tin coats to copper. Is there an equivalent for silver?
Pete Mcquail, G8DCJ

2243. Fairly direct plotting of PCB s

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-06 00:00:00 UTC
From: Bob Mueller <IFF161@DJUKFA11.BITNET>
Message-ID: <96097.211108IFF161@DJUKFA11.BITNET>
Source record: 106270

While throwing out a few suggestions to the fellow who wanted to run PCB stock through his printer I was called to the thinking stool and now have a proposal. I hope somebody will try it and let us all know!
The chemistry assumed in the following is ancient and has been used commercially in the printing industry for making copper printing plates and/or silk screens. It is not too half-baked to be practically sure of failure!
To make resist in place on a PCB:

1) Coat the copper foil with a suitably dilute "solution" of gelatin or egg albumin (or just plain egg white.) I think gum Arabic also is used and Elmer's glue is another potential candidate. You want a tight layer without pinholes or other defects, and rather thin.
2) Get an old pen for a plotter of the type you have available. Wash it out well. Felt tips pens in good condition ought to work but "Rapidograph" pens probably will yield better results. Fill the pen with a dichromate, where sodium, potassium or ammonium are all good candidates. Use this to plot the PCB in your plotter. (A bit of dye in the solution might help. but don't use it at first. It would let you see the lines but if the type of dye is badly chosen it could absorb too much of the precious UV you will soon be using for fixing the coating.)
3) Expose the dried PCB to a strong UV source for awhile. I think near UV is sufficient and far less nasty for the eyes than the deep sort of UV. I have no proposal for the duration of the exposure except it is likely to be several times longer than needed for conventional photresists. Overdo it at first, then cut back if the resist is curing, or add a still greater dose of "overdoing" it.
4) Rinse in warm water. Somewhat above body temperature is probably good enough. Raise the temperature if your starting temperature seems not to be taking off the unwritten parts of the resist. Rinse well enough to get off all the unwanted coating.
5) Dry well. Baking at a moderate temperature could aid fixing of the resist and give better durability.
6) Etch as you always do.

7) If all else fails, try finding an old book describing the process a little more completely for printers and silk screen printers. There will be nothing on all of the above but you will learn about temperatures, etc.

NOTE: My editor does not allow me to add this above- I am sorry. A good concentration for the dichromate is about 2% by weight in water, for starting, at least. (Treat the dichromate with good sense- like a lot of things, it is believed to be a carcinogen. Do not inhale dust: wash your hands after working with it.)

I expect some hopeful results at an early stage for anyone trying this.
Getting the process perfected probably will take some experience. Some
possible hints:
A wetting agent could help getting the "ink" to write well, but
probably is not needed as the coatings have good water afinity.
The right dye will aid inspection of the plotter's efforts before
doing the exposure. The wrong dye could ruin everything.
A double pass of the plotter might improve results. The "ink" must
get down into the coating; however, writing on a still wet coating might cause
a Rapidograph to plow up the resist, so some caution is needed.
I believe the resist changes appearance when it is sufficiently
exposed so you may get a clue when to stop.
This stuff is not very light sensitive, in case I must tell you that,
so working in a normally lighted room ought to be safe, except fluorescent
lamps may emit too much UV. Tunsten is recommended.
Suppliers for printers can probably sell you the ingredients which you
can't get elesewhere. Some hobby shops could have supplies for silk screening,
or try a good supplier for artists. I hope I do not have to tell you where to
get gelatin or egg whites (refined albumin is probably a little better, however
and it will be harder to get.)
Happy experimenting!! A little time invested in development might
lead to a lot of convenience later, especially for us if you pass on your
successful recipes.

Bob

PS For those who are in places where Elmer's is not known, look for a PVA
type of glue. These are the white sort used for wood and sometimes paper.
Not very treatening to the health as far as I know.
I do not know how you remove the resist after the etching is completed
but try even hotter water. Bleach probably works if the hot water does not.
Or Draino. These will get most organic materials. Tey convert many organic
things to some kind of soap, so use them with care. If you get them on your
hands, that soapy feeling is not the chemicals, it is you. Rinse well and soon.
Wear eye protection against splashes.
Mechanical methods, probably on the well-wetted, resist should be just
fine and not too much labor.

2244. 6M antenna tuner designs?

>Pete Mcquail, G8DCJ
Many many years ago ie. about 30 when I was but a lad there was an
article in one of the radio mags, radio constructor maybe? This
described how to put track ont glass, it involved laying down a layer of
carbon and then plating this with silver. Unfortunately the only two
things I can remember are that a) it involved heating something like
siver nitrate and passing the fumes over the track and b) my dad, who
was a chemist said it looked a bit dangerous!
So it is possible that way. On the other hand how about
electrolosis (sp?) join all the tracks together and connect to a dc
supply and place in a conductive solution, salt water? Connect the other
side of the supply to an old piece of silver, tea pot etc.
I'm sure that someone will come up with a better idea and if they
do I may be tempted to try it too. I've etched a fair few pcb's and the
one thing that lets them down is the finnish so this could be the
answer.
Good luck.

Yep, and yep (emphasis on the 'were'). It's interesting to look at an
old sweep tube like the 6BG6 (an 807 with an octal base) and compare it
to a more modern tube of about the same plate dissipation. The modern
sweep tube will have a cathode 2-3 times larger. -Lots- of peak
current capability.

Yeah, but that refers to *physical* ruggedness, not increased
electrical ruggedness. In the latter regard, it is no different
from a 6146A. The 6146B has 10 more watts of plate dissipation.

>system which isn't charging continuously.

Look a little bit more. Bussman makes some very nice, light weight fuses at low values. However, they may fail completely if the battery is capable of supplying too much voltage/current. This is because there is an internal resistor used to heat a bi-metal strip which trips when the current draw becomes too great. Under extreme faults, this resistor opens up, just like a fuse! This also means that the trip point changes with ambient temperature, which you just might find problematic for sailplanes.

The PolySwitch (tm) has a limited life, slow trip time, and is sensitive to ambient temperature. Note also that the polyswitch opens up by becoming a high resistance, which gets REALLY hot when it trips. This means that the load on the battery doesn't dissappear when the PolySwitch (tm) trips.

PolySwitches (tm) find application especially in places where it is INCREDIBLY difficult to change a fuse (i.e. a craftsperson might need to climb a telephone pole, you might need to send an instrument back to the factory to get access to the fuse, etc.).

>Any suggestions?

If it was me, I'd use a fuse. It's lightweight, reliable, and fast.

YMMV.

2254. Question: Xtal Grinding Technique

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-07 00:00:00 UTC
From: rmwatson@eskimo.com
Message-ID: <DpH3Hq.6Ez@eskimo.com>
Source record: 106182

I recently was discussing with a friend of mine, a technique that seems to be quite interesting, yet seems almost too good to be true. I was wondering if anybody else has heard of this technique?

It is used when regrinding crystals from a lower frequency to a higher frequency, (what else?), anyway, here goes:

You take a sheet of aluminum foil and lay it down on the workbench, and upon the top of the aluminum foil you lay a sheet of glass. You take some jumper wires and connect one end to the aluminum foil, and the other end to the center conductor of your receiver. You then take the receiver and tune in to the "target" crystal frequency. You then begin to grind the crystal, (using Comet and water, or some other recommended abrasive, in the figure-eight pattern), and while you are grinding, you will begin to hear the oscillation of the crystal through the receiver.

I was told that this will bring the frequency to close proximity, but I was thinking you could also use the audio filters to "narrow" the target.

Has anybody tried this out at one time or another, and if so, do you have any further suggestions that may help me (or others)?

Thanks much,

Robert/KJ7BO

On some crystals you can take them DOWN slightly by putting lead on the
surface with a pencil. Your same technique (omitted here) might also apply.

One of the old tricks to 'warp' a crystal is to put an inductor and
variable capacitor in series with it. Depending on how "lazy" your
crystal/oscillator combination is, you may be able to warp the
crystal quite a bit. As a Novice, I had only one 15 meter crystal and
was able to cover most of the 15 meter band with it: It's stability
was terrible near the bottom, but it worked... Typically, you'll
be able to move the crystal below it's original frequency more
than above it...

Modern crystals have electrodes which are plated onto both sides of
a quartz disc, making it difficult to grind or etch the quartz without
damaging the electrodes. You can move the resonance DOWN by depositing
pencil lead or some other mass on the quartz surface, but this dampens
the natural oscillation and results in a "sluggish" crystal which might
not oscillate properly in most circuits.

If you want to try the old grinding technique (it really does work), you
should get one of the war surplus FT-243 crystals, or any crystal which
uses a disassemblable pressure holder. You can remove the quartz blank
from the holder, grind it, and reassemble.

Beware!. If the grinding process is not carefully controlled, you'll end
up with uneven thickness, and the thing won't work. Best to grind a
little, try out the whole assembly in your circuit, then grind some more.

Which Model are you trying to use? I have one that has a dynamic mic
element, and all I did was to bypass the electronics, and feed the radio,
Kenwood TS-940, direct. The output is lower than most dynamic
elements, but it works good.

There is no fundamental (no pun intended) difference. Radios that use one
crystal for transmit and another for receive need the two different
frequencies to compensate for the intermediate frequency offset. In
otherwords, if the i-f is 10.7MHz, then the receive crystal will be either
10.7MHz above or below the transmit crystal frequency.

Me and a few of the local hams are putting together an Amateur Balloon

We are in the fist stages of equipment design and I'm the lucky (or is that unlucky) one who gets to build the instrument package. For the first flight we are going to use a Basic Stamp (I or II not sure yet) to send telemetry and collect data from onboard sensors.

I have completed the temperature sensors and i am looking for a way to determine the altitude of the balloon (low cost needed) I have heard of a few chips or rather modules by motorola that do this. If anyone can help we would be most greatful.

I have used the "loading" technique with mixed results. I have used
a pencil and the side of a piece of solder. The main problem I had
was that the vibration of the crystal caused the "loading" material
to move or fall off resulting in frequency drift. However it
worked long enough to get the proper crystal.

I have found a reasonably good source of solar panels is
Jade Mountain
pobox 4616
Boulder ,CO 80306-4616
(800) 442-1972

They have new and used stuff that would probably give you what you need. The
only bad part about this company is there 'appropriate' terminoligy.
It allways sounds so judgemental!

The bad news is the cost per watt of output goes up the smaller the pannel is!
a 60 watt used panel is $220 ($3.67/watt)
a nice portable 10 watt unit is $135, ($13.50/watt) but these size/price
ratios vary.

anyway call them and get there catalog.

Sure, with some caveats. A crystal is a crystal, and is just a source
of a stable frequency (when used in a proper oscillator circuit). The
caveats are that the frequency *stamped* on the receive crystal may
include the IF offset of the intended receiver, IE 10.7 MHz above or
below the actual frequency of oscillation of the crystal as one example,
and that receive crystals in general can't handle as much RF current as
some transmit crystals. This latter is of vanishing importance since most
transmitters today don't require much crystal current either, but some did
in the old days. The former is the gotcha, make sure that you know the
frequency on which the crystal actually oscillates. It may not be the
frequency stamped on the case with crystals intended to be used in
receivers.

>Pete Mcquail, G8DCJ

I'm curious about why you want to do this. In my career as a design engineer, I've never seen a silver-plated board, just gold, tin, or tin/lead. Silver is widely used for conductors on thick-film hybrid circuits, but generally alloyed with palladium. The alloying is necessary because without it, the silver will migrate in the presence of applied D.C. (particularly in high humidity), eventually forming short-circuiting tendrils between conductors. The palladium-silver alloys I've seen are much less conductive than copper. I'd think that silver would be inferior to tin as a plating material because of its tendency to tarnish. It might also try to alloy with the underlying copper, requiring a nickel barrier, as is done with gold plating.

Hello all...

I saw at one of the local swap meets a digital readout for the
ATLAS 250. The guy wouldn't seperate it from the radio for which
I don't blame him. However, I would sure like to have one of
those units for my ATLAS. So this leads me to two questions.

#1. Does anyone out there have the DFC for the ATLAS that they
would like to sell?

#2. Does anyone know of any articles that may have been published
in QST, CQ, 73 or HR on how to build one for the ATLAS.

What I really would like is a master index on line of the
articles published in the ham mags for the last 25 years.

Anyone know of such a resource?

Thanks all...

_____________________________________________

1.0 What is BASIC Stamp ?
-------------------------

This is being written for people who have no idea of what a BASIC
Stamp is...

BASIC Stamps are small reprogrammable single board computers (SBC)
that run BASIC programs and are made by Parallax, Inc. in US. At
first glance, they may seem fairly minimal - and in fact, they are.
But with software that fully utilizes all available hardware, the
Stamps give you powerful features - without the cost of hardware.

Their low cost and simplicity make the Stamps perfect for many
prototyping and control applications. It's suitable for electronics
hobbyists as well as electronics professionals in many different
areas.

Typical application areas for BASIC Stamp's are...

- General electronics
- Home automation
- Robotics
- Mini PLC
- Education
- Prototyping
- HAM related applications
- Special effects in films
```

- Industri control
- Geological instruments
- Computer peripherals
- Scale model hobbyists

As an talent engineer and technical writer expressed it...

- BASIC Stamp is the 555 of the 90's !

1.1 What is L.O.S.A all about ?

I started to compile L.O.S.A because I know there are lots of great ideas and many problems that are solved with the BASIC Stamp and the main purpose of this list is to get an idea of what other people are using their BASIC Stamps for and maybe get some inspiration or hints.

Remeber it's up to all of us if this list are going to be any good and I'm looking forward to receive a description of your application.

1.2 How can I contribute to this list ?

If you have done something with the BASIC Stamp (big or small) that you are willing to tell others please use the form given below and write a short description, nothing fancy is needed just a simple explanation. If you have source code to share that's even better but it's not necessary.

Then e-mail the form to:

cj@hth.com

With the following as the subject:

L.O.S.A Contribution

Or you could point your Web-browser to the following URL and fill in the L.O.S.A form on the Web-page...

http://www.hth.com/losa.html

[--- cut ---]

1.3 Where could I find L.O.S.A ?

The latest version of L.O.S.A is going to be posted to the following
mailing lists and news groups, I will update it approx. once a month.

Mailing lists:

BASIC Stamp Mailing List

News groups:

comp.robotics.misc
comp.home.automation
sci.electronics.misc
rec.radio.amateur.homebrew
rec.radio.amateur.misc

FTP-site:

ftp://ftp.parallaxinc.com/pub/text/losa.txt

You can also find the latest version on the following URL...

http://www.hth.com/losa.html

1.4 List of contributions

> = Indicates a new or updated application since last time.

==========
Title : Robo-Cat [# 001]
==========
Date : 950807
Author: Gustavson Guy W.
E-mail: GWGUSTAVSO@mpg.norstan.com

Stamp model : BASIC Stamp Rev. D
Code available: N/A
Filename : N/A
URL : http://www.winternet.com/~bigfoot/cat.html

Description :

My cat, Kesha, was recently diagnosed with Heptic Lipodosis. Or
"Fatty Liver", basicly what this means is that for some reason he
stoped eating and his liver started converting body to useable
sugars. The fat deposists biuld up in the liver and cause severe
liver damage. Because the liver isn't working well the cat feels
crappy and wants to eat even less. The treatment for this disease is
to run a tube down down the cats nose into his stomach, or a PEG
tube through the abomine wall into the stomach and feed the cat a
liquid diet this way.

I love my cat, but I can't be there every three hours to feed him
through the tube for a month. Something about work and deadlines and
such. So I went to a local supplus house and got a tiny motor driven
pump, a case, some switches, a micro switch, ect...

The micro switch is mounted such that the switch trips for every
rotation of the pump shaft. The stamp turns on the pump for on a
single rotation at intervels programable from the controll switches
on top. An alarm buzzer and LED flash if the pump fails to run for
any reason. The unit is programable for 9 differents deleviery rates.

Now he gets a slow continuious feeding and he seems to tolerate this
better than the 100ml feeding every three hours.

==========
Title : Logic Rudder [# 002]

==========
Date : 950812
Author: Christer Johansson
E-mail: cj@hth.com

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : LRUDDER.ZIP
URL : http://www.hth.com/filelibrary/BS1-IC/

Description :

Many of the new and very realistic flight sims available today needs rudder to let you get full control. This one uses a digital pot from Xicor (X9104) and 10 other components. Connects to a standard IBM-PC game port and power is taken from the port.

It uses two micro switches for controlling the rudders left or right and to indicate when rudders move there is a red LED that lights up when you press the micro switches and to indicate center there is a green LED. If you press the both micro swithes the rudder will automaticly return to center position.

There is a trim pot to set the desired step rate from slow to very fast and the Xicor pot has 99 steps wich gives a fair resolution.

==========
Title : Interfacing MAX186 8 channel 12bit A/D [# 003]
==========
Date : 950925
Author: Helmut Fligge
E-mail: h.fligge@asco.nev.sub.de

Stamp model : BS1-IC
Code available: YES
Filename : N/A
URL : N/A

Description :

This Program interfaces the Stamp1 to the MAX186 A/D converter. Via RS232 2400bps the stamp is asked to measure channel numbern. After conversion the result will be returned to the host computer as an ascii string (0 .. 4096). Conversion rate is about 4 measures per second.

==========
Title : Scrolling LED Sign [# 004]
==========
Date : 950926
Author: Bob Blick
E-mail: Bob_Blick@redwoodfn.org

Stamp model : BASIC Stamp Rev. D
Code available: Maybe sometime
Filename : N/A
URL : http://www.execpc.com/~bblick/stamp.html

Description :

Scrolling LED sign, 35 super-bright LEDs in a 5-by-7 matrix in the prototyping area of a Basic Stamp rev D. A scrolling alphanumeric message moves one pixel at a time, just like real scrolling LED signs, except this one only displays one full letter or portion of two letters at a time as the message moves by.

==========
Title : Tone Decoder [# 005]
==========
Date : 950926
Author: Bob Blick
E-mail: Bob_Blick@redwoodfn.org

Stamp model : BASIC Stamp Rev. D
Code available: Soon
Filename : N/A
URL : http://www.execpc.com/~bblick/stamp.html

Description :

Listens for telephone touchtones, displays phone numbers on LCD screen and echos them out RS-232 port. Circuitry fits in prototyping area of rev D Basic Stamp:

Microphone preamplifier, touchtone decoder IC.

==========
Title : Pager [# 006]
==========
Date : 950928
Author: Don McKenzie
E-mail: donmck@tbsa.com.au

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : PAGER.BAS
URL : http://www.labyrinth.net.au/~donmck

Description :

This program for the Basic Stamp is used to monitor 4 hardware signals. If a change takes place, (after testing for a false trigger) then a cheap 2400 baud MODEM is used to dial into a Telecom Alpha-Numeric pager. It leaves a message which consists of a 2 digit

I.D. (01 to 99) followed by the 4 signal levels of pins 3 to 0.

Status of the signal levels message: 0=Low, 1=High. EG: "011110"
means Unit "01" has pins 3, 2, and 1 high, and pin 0 is low.

A "Ring-In" feature is also included. By ringing the MODEM for a
short period, then hanging up, the Stamp will dial your Pager and
report the current hardware status of these four signals.

This program uses about half of the available memory, so if the user
wishes to add enchancements such as "Multiple Ring-In's" say within
a minute, for a command selection, there is plenty of program space
left.

```
=============================================================================
Title : HexWalker Mobile Robot [# 007]
=============================================================================
Date : 950929
Author: T. R. Thornton
E-mail: mandtsys@ix.netcom.com
-----------------------------------------------------------------------------
Stamp model : BASIC Stamp Rev. D or BS1-IC
Code available: YES
Filename : WALK.BAS
URL : N/A
-----------------------------------------------------------------------------
Description :
```

HexWalker is a six legged mobile robot that is controlled by a BASIC
Stamp or BS1-IC, and driven by three servo motors (similar to Futaba
S148). It is the simplest walking machine architecture that can walk
forward, backward, and turn left or right.

```
=============================================================================
Title : Robo Bug [# 008]
=============================================================================
Date : 951003
Author: David Novick
E-mail: dkn@cimar.me.ufl.edu
-----------------------------------------------------------------------------
Stamp model : BS1-IC
Code available: YES
Filename : N/A
URL : http://www.me.ufl.edu/~dkn
-----------------------------------------------------------------------------
Description :
```

Using two stamps, a robot with six legs (2 degrees of freedom each)
was able to walk and turn (at this stage, not very gracefully).

```
=============================================================================
Title : EXPBOT Robot controlled by Stamp [# 009]
=============================================================================
```

Date : 951009
Author: Marvin Green
E-mail: marvin@agora.rdrop.com

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : EXPBOT.BAS
URL : E-mail author and he will send it

Description :

This program allows a cool robot to move abound a room in search of light. Like a moth. Simple program changes can dramatically change the robots behavior.

==========
Title : Andrews Ever Evolving Lego Robot [# 010]
==========
Date : 951119
Author: Andrew H. Hochheimer
E-mail: softarts@ciaccess.com

Stamp model : BS2-IC
Code available: YES
Filename : N/A
URL : http://www.wincom.net/~softarts

Description :

Currently the robot can only navigate to the brightest light source in a room. It's current operation mode has four major steps: - Scan a 180 Degree Field of "Vision" taking light level readings, and determining the brightest direction of light. - Decide if it needs to turn left, right, or continue moving forward. - Check for collision with an object while moving, if a collision occurs, display the total travel distance on the display - Move forward for 1.5 Seconds and then repeat the process.

Currently I am using Two Futaba FP-S128 Servos (any RC Car Servos would work) one to sweep it's "sensors" form left to right, and one to "stear" the robot.

You can see pictures and more information on my homepage, just follow the lego robot link.

==========
Title : Factory Monitoring System [# 011]
==========
Date : 951120
Author: Paul Willemse
E-mail: pjwill@merlion.singnet.com.sg

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : N/A
URL : E-mail author

Description :

The system presently consists of 4 Basic Stamp units. Each monitors up to 5 inputs. The inputs are 'digital' (switches) and/or analog (temp, airflow, current, etc using commercial sensors). All stamps communicate the results via serial mode to a Macintosh (Yes a Mac!) where the results are graphically displayed and monitored. Alarms are set for certain conditions.

The transmission is simple, one way only. Each stamp sends the info at a 'random' interval not exceeding 2 seconds. The message format is fixed, the Mac will throw away any conflicts in case two or more stamps transmit at the same time. BTW this happens very seldom. The max time any stamp can be 'absent' from the chain before an alarm is raised is six seconds (failure, transmission collisons, etc). This is controlled by the Mac.

The 'system' is presently in beta test, the client wishes to expand up to 20 stamps. At that point we will likely use the BS1-IC or BS2-IC on custom boards located around the facility.

Code is available upon request (e-mail) partial, some is proprietory to my client.

==========
Title : Wave to the Cats/Desk Temperature [# 012]
==========
Date : 951121
Author: Paul Haas
E-mail: paulh@hamjudo.com

Stamp model : BS1-IC
Code available: Yes
Filename : See web server
URL : http://hogwild.hamjudo.com/cgi-bin/stamp

Description :

The Stamp has a serial connection to web server, a cardboard hand, a servo motor to move the hand, and a DS1620 thermostat chip to measure the temperature. The web server can request the current temperature or start the hand waving. See the web page for the source code for the temp and the web server.

It's mostly useless. The cats ignore the hand. A few people find it entertaining.

```
=========================================================================
Title : Gamer's Die Roller [# 013]
=========================================================================
Date : 951122
Author: Larry Tremblay
E-mail: ltremblay@domus.com
-------------------------------------------------------------------------
Stamp model : BS2-IC
Code available: N/A
Filename : N/A
URL : N/A
-------------------------------------------------------------------------
Description :

The Gamer's Die roller is a little thing I am putting together as my
first Stamp Project. The Roller allows cumulative rolls of n dice up
to 256 sides, so long as the sum does not exceed 99,999,999(!)

It uses two 74HC161 4 bit counters cycling at 1MHz to draw random
numbers off of. Input is achieved via a Grayhill model 38 keypad
and a 74C922 keypad decoder. Display is on a Siemens PDSP-2111 8
character smart display (5x7 LED characters) fed by two 74HC164
serial to parallel shift registers cascaded so I can use Shiftout to
feed 16 bits of control + data off of 2 pins.

The code is very simple, the most exotic part being the random numb-
er generation. In a nutshell, it is:

Begin Loop
S = 8 bit number drawn from the counter (random)
if S < (255/N) x N (integer divide, N is number of sides on die)
exit Loop
End Loop

This gets (pseudo) random numbers whose average is not skewed
downwards by the counter's max of 256 (i.e. a 100 sided die is not
affected by the extra 56 in the count maximum)

Using gamer's dice notation, (5d6 = sum of 5 six sided dice, 3d10 =
sum of 3 ten sided dice), the user can input whatever combination
they wish, including just 'd6' for one six sider. The keypad I have
has removeable keycaps with legends, so I have 0-9 plus 'd' and '='
on them.

As noted earlier, since I am using an 8 bit counter, the maximum die
size is 256, although that could be fixed easily by sampling two,
three or more times for each die.

Anyhow, that's it. When the code is done and debugged, I'll be happy
to e-mail it to any who want it.

=========================================================================
Title : Stamp II Serial I/O [# 014]
=========================================================================
```

Date : 951128
Author: John Hansknecht
E-mail: Hansknec@cebaf.gov

Stamp model : BS2-IC
Code available: Yes
Filename : HAL01.bs2 and HAL01.bas
URL : ftp.parallaxinc.com

Description :

A bare-bones demonstation of 2 way serial communications between a
PC running Qbasic and 1 or more Stamp II's.

==========
Title : Voice and CW Fox Hunt Transmitter IDer [# 015]
==========
Date : 951221
Author: Sam Guccione
E-mail: sguccion@outland.dtcc.edu

Stamp model : Counterfeit Stamp
Code available: Yes
Filename : Revision of S. Edwards MORSE program
URL : N/A

Description :

An IDer based upon the MORSE program. Has 4 time delays as well as
a random time delay. Circuitry includes selection of a voice id
using the Radio Shack 10 voice board or the Walden bookstore 10 sec
talking gift card. This is a very simple circuit and program but was
developed by my students under my direction.

May be of interest to someone out there.

==========
Title : Lift (elevator) Controller [# 016]
==========
Date : 951225
Author: Dave Bell
E-mail: dbell@cup.portal.com

Stamp model : Faux Stamp (BASIC Stamp clone)
Code available: Yes
Filename : Upon request
URL : N/A

Description :

A simple control loop monitoring lift Call buttons (with debounce)
and Limit switches, forbidding manual control past limits, and en-

forcing a Stop before reversal of direction. This will be used in
an owner -designed and -built single story platform lift for a home.

==========
Title : Paging with the Stamp [# 017]
==========
Date : 960104
Author: Kurt Clement
E-mail: kclement@kraft.com

Stamp model : BASIC Stamp Rev. D
Code available: Yes
Filename : monitor.bas
URL : N/A

Description :

Use the Stamp to monitor several inputs, two temperature and two
contact closures in this application. When inputs go outside set
limits, dial pager and send coded message. Used to monitor power
failures and temperatures for computer and network equipment since
August 1994, running on 9 V power supply from one of the UPS units.

==========
Title : Switching Sytem [# 018]
==========
Date : 960109
Author: Alexander Avendano
E-mail: aavendan@aros.net

Stamp model : BS1-IC Module
Code available: N/A
Filename : N/A
URL : N/A

Description :

I'm almost finishing a Basic Stamp Based Switching System (Small
Phone system) which I consider very usefull for small companies that
cant'n afford other brands. This is designed with a host computer
which will have a vox-mail and all the functions like big ones to
choose. I'm using BS1-IC's for the extensions process right now.

As soon I have complete it I will give the code away for small
Intelligent Switching phone system up to 2 Lines and 4 Extensions
using the L.C.D serial circuitry for information display. I forgot
to mention that the computer (Host for many processing functions)
will be running under Windows 3.1 and Windows 95, making this way a
usefull computer not only for the phone system but for ithers
application at the office.

Please be free to send me E-mail, about any suggestion.

```
=============================================================================
Title : Door Entry Card Reader [# 019]
=============================================================================
Date : 960110
Author: Ed Buckley/J J Barbarello
E-mail: ed@milinst.demon.co.uk
-----------------------------------------------------------------------------
Stamp model : BS1-IC Module
Code available: YES
Filename : N/A
URL : N/A
-----------------------------------------------------------------------------
Description :

Stamp 1 based version of the Card Reader article by J J Barbello as
described in the August 1995 edition of Electronics Now. This vers-
ion uses the Stamp 1 as a local controller determining the card
number and deciding whether or not to allow door opening. Optional
serial comms back to a master controller and optional local message
readout using an LCD Backpack.

Lots of scope for further enhancement/experimentation. Circuit
schematic and listing available.

=============================================================================
Title : Telephone Card Reader [# 020]
=============================================================================
Date : 960119
Author: Francesco Volpe
E-mail: f.volpe@ee.mu.oz.au
-----------------------------------------------------------------------------
Stamp model : BS2-IC Module
Code available: YES
Filename : TELEMARK.LZH
URL : ftp://ftp.ix.de/pub/elrad/010/
-----------------------------------------------------------------------------
Description :

The BS-II is used to read a German telephone card, which is a smart
card. For more details see the German Electronic Magazine ELRAD
(http://www.ix.de/el).

The data is transfered via RS232 to any terminal program.

=============================================================================
Title : DTMF Decoder [# 021]
=============================================================================
Date : 960125
Author: Joe Altieri
E-mail: radioman@banished.com
-----------------------------------------------------------------------------
Stamp model : BS2-IC Module
Code available: YES
```

Filename : DECODE.BS2
URL : N/A

Description :

A new parallax BASIC Stamp II program for decoding a nine digit DTMF sequence of "Touch Tones" for remote activation/de-activation of any electrical appliance via Ham Radio, radio link, telephones, intercoms, etc.

==========
Title : Ion chamber radiation monitor [# 022]
==========
Date : 960125
Author: Jeffrey L. Rothman
E-mail: rothman@bnlls1.nsls.bnl.gov

Stamp model : BS1-IC Module
Code available: YES
Filename : RADMON12.BAS
URL : N/A

Description :

A Basic Stamp monitors the operation of an ion chamber radiation detector. The ion chamber and related circuitry produce a signal with a frequency proportional to the dose rate. The Stamp measures the frequency and calculates the dose rate and total integrated dose.

The results are displayed on a log scale panel meter and an LCD respectively. The dose rate is also transmitted over RS-232 to a remote PC.

A Front panel button allows the user to reset the total integrated dose. Another button allows the audio alarm to be muted at low dose rates.

==========
Title : Barn Monitor [# 023]
==========
Date : 960203
Author: Lynn A. Roth
E-mail: lynnr@hesston.edu

Stamp model : BS2-IC Module
Code available: YES
Filename : N/A
URL : E-mail author

Description :

The Barn Monitor checks the temperature in 5 rooms of a farrowing house. The temperatures are taken by DS1620 chips.

If the temperature goes outside the limit set by the farmer, the Stamp dials a pager using a 2400 baud MODEM. The same occurs if the power goes out.

==========
Title : Dallas one-wire interface [# 024]
==========
Date : 960212
Author: Daniel G. Clemmensen
E-mail: dgc@shirenet.com

Stamp model : BS2-IC Module
Code available: YES
Filename : N/A
URL : http://www.shirenet.com/~dgc

Description :

As part of a furnace controller project, I've interfaced A Stamp II to a string of Dallas 1820 digital thermometers. The interface consists of three cheap IC's and some subroutines. A design note and a demo program are available on the web. I have successfully tested the interface with a string of twelve 1820's.

I have not yet tested it with other one-wire devices, although I will update my web site when I do.

==========
Title : Sculpture control [# 025]
==========
Date : 960323
Author: Pierre Olivier
E-mail: olipie@aei.ca

Stamp model : BASIC Stamp Rev. D
Code available: N/A
Filename : N/A
URL : N/A

Description :

I have been working with sculptors for some time doing control circuits for their works using 555 (limited), industrial controllers (expensive and hell to program) and lately Basic Stamp.

Our latest piece deals with image deconstruction: it consists of 20 vertical cylinders on which an image is wrapped. Each has a photo detector to detect "position zero", and a custom basic stamp board with a MC3479 step motor driver that drives a step motor which turns one cylinder. Each cylinder can thus have its own routine which pos-

itions it precisely (400 steps/rev motors) where we want it for any amount of time, at any speed (very interesting sonically at sub-second stepping speeds!).

The stamp outputs direction, step and enable signals to the motor driver and a ready signal to a common line. It receives signals from the aforementionned ready line, and from the optical sensor.

It would have been quite a bit more complicated, bulkyer and expensive to implement this project without the stamp.

```
=============================================================================
Title : Commercial clothes dryer controler [# 026]
=============================================================================
Date : 960401
Author: J Amy
E-mail: Kuznjack@aol.com
-----------------------------------------------------------------------------
Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : N/A
URL : N/A
-----------------------------------------------------------------------------
Description :
```

Detects drop of coin and increments time remaining register. Actuates main and heat relays. Checks temperature, and controles heat relay Periodically decriments time remaining register. Provides cool down cycle in last four minits.

Replaces original controler which costs several hundred dollars, and is not reliable.

```
=============================================================================
```

1.5 Credits and other things

Credits should go to all of you who makes this list possible I hope it suffices to say "Thank you to all who have contributed to L.O.S.A - we all appreciate it."

Special thanks to all of you at Parallax, Inc. who makes and support this great products !

If there is anything you think I've missed (or spelled wrong <g>) I would love to hear from you so we could make this list even better.

You could reach me at the following e-mail address: cj@hth.com

Stay tuned,

/Christer

2278. YAESU FT-200 Help?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-08 00:00:00 UTC
From: George Harris <103021.3555@CompuServe.COM>
Message-ID: <4kb3r1neu3@mhafc.production.compuserve.com>
Source record: 106206
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.cb

Hi Everyone,
My Friend has an Yaesu Ft-200 Radio and is looking for a
possible modification to include 11 meter capability. Does anyone
know of such a modification. All answers are appreciated.

Thanks!!!!!!
73,
George

--
Don't do anything that I wouldn't, At least don't get CAUGHT!!!!

2279. Re: Atlas Digital Frequency Readout

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-08 00:00:00 UTC
From: Jim <jstrohm@texas.net>
Message-ID: <4kb4na$oap@newsgate.sps.mot.com>
Source record: 106207

Communication Concepts (I think) also made a universal digital readout that worked with the Atlas. This was advertised in the usual magazines a few years ago and may still be available.

I got one in about '91 for my Atlas 210 and was pleased with it, even though it cost nearly as much as the rig did (used). It's all TTL and could be duplicated in wire wrap.

Of course, it's more cool to have the Atlas digital readout....

I am wondering about the feasibility of the following scenario: A person gets his boat wrecked on an uninhabited island nearby Hawaii. He has no electricity, but lots of wire from his smashed up boat. He uses it to make a directional antenna that is pointed toward Oahu, and tuned to the FM broadcast band. Then he keys in SOS by shorting the antenna.
I am thinking this analogous to using a mirror to flash code using the sun's light. In this case, interference should be created either at the FM frequencies, or if the person was able to construct a diode, multiples thereof.
My question is, could this produce a detectable effect which might have the slimmest chance of getting the person rescued; or can anyone think of another possible example of "powerless communication"?

Source record: 106209

Many thanks to Gary, Jack, Dana, Mike, Tom, and Grant who have talked me out of hacking on my radio, and reminded me of some electronics that I should have remembered all along. Here's what I've learned:

It is usually improper adjustment, rather than IMD from nonlinearity, that causes low-level-modulated AM to sound bad.

High-level modulation of a transistor final is much more complicated than just lifting a leg of a transistor and sticking a transformer in the circuit.

If I ever want to try this, I'm definitely going to start with a 50W CB pre-driver and hack on THAT, rather than mess up my main rig.

When ten meters comes back and I want to get on AM again, I'm getting a peak-reading wattmeter so I can adjust my transmitter properly.

There are still some folks out there knowledgeable enough about AM and nice enough to lend a hand.

Thanks again and 73

: receivers.

Of course, the same is true of crystals stamped with the transmitter frequency: the crystal likely will oscillate on a fraction (like 1/9 or 1/12) of the actual transmitter output frequency; in some cases there is even an IF offset on transmit as well as on receive (e.g., a crystal-controlled HF SSB transmitter). (Though in that case, the rig would likely use one crystal for both receive and transmit.) And to further complicate things, often both the receive and transmit crystals will be stamped with a "channel number" instead of an actual frequency. It's not only the CB band that's channelized.

If you are lucky, the crystal may be stamped with _both_ the frequency of oscillation and the radio input/output frequency.

2284. Six Meter Transceiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-08 00:00:00 UTC
From: Dave Ward <dave.ward@nt.com>
Message-ID: <31696059.41C67EA6@nt.com>
Source record: 106212

A few days ago there was a message posted that indicated a design for a 6 meter transceiver had been described in the Sept. 1995 issue of QEX. The author of the article was Zack Lau.

I would be interested in looking at the article and possibly building the transceiver if it more or less meets my requirements and is within my capability. My requirements are CW and SSB, power output in the 5 - 20 watt range, all solid state and readily available parts. A commercially available PCB would be nice.

Does anyone know where I can get a reprint? Is it in the 1996 ARRL Handbook (which I plan to purchase)?

Thanks.

Hi, and thank you for reading this

I have a HAM III/CD44 (CDE) rotor and controller, the rotor works really well, however the heading indicator stopped working yesterday, it just won't "track" anymore and the needle is not physically stuck, I fear that I may have misplaced a wire and I don't have the schematic/owners manual. Does anybody out there know how to find out how the wires are connected ?, any troubleshooting techniques for the meter?, could anybody send me the text or the GIF of the Schematic (or both)?, where can I get an old owner's manual?/ book?

Any help appreciated, thanks in advanced

2287. Error in Motorola RF Databook?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-08 00:00:00 UTC
From: jeffd@coriolis.com
Message-ID: <4kbqlr$bu0@globe.indirect.com>
Source record: 106215

I know a lot of Motorola guys read this group, and this question is directed mainly to them. In my 1983 copy of the Motorola RF Device Data book, the data sheet for the MRF497 transistor contains a test circuit and PC board for what would be a whopping good start on a 35-45 watt 6M power amp. (Page 4-126 of that edition of the book.)

The problem is that the schematic doesn't seem to match the PC board or the photo of the assembled test fixture. The photo shows four Arco trimcaps, but the circuit calls out only three. The coils seem in the wrong places on the circuit board vis a vis the schematic, and I've started to wonder if either the schematic or the test fixture PCB and photo are wrong for that data sheet. Does anybody have any clue here?

As RF Parts sells the MRF497 for $19.95, it would be pretty easy to build the amp, if I knew I could trust both the circuit and the PCB.

Thanks in advance for any help here.

The objective is to reduce losses and improve overall efficiency in
VHF/UHF RF circuits. As I understand it the silver layer should reduce
losses by providing a better (than copper) conductor for the 'skin
effect' currents at these frequencies. I assume that this is why silver
plated wire is recomended in these RF circuits. Obviously gold would
provide an even better conductor but my finances do not run to providing
gold plating services for one off type runs. I suspect also that a
permit would be required here in the UK for such activities.
Would not the problems of surface corrosion etc be reduced or even
eliminated by the use of a non-conductive varnish?
Pete Mcquail, G8DCJ

I saw something about this place a while back on ham-homebrew but had no opportunity to get there until last Friday.

The place is City Electronics in Bellaire (Houston). He is, unfortunately, only open 9 to 5 Mon-Fri. He has a phone (713-663-6066) and does MC/Visa and shipping.

He has fun stuff like high wattage pots and tube sockets. He also has the more modern stuff like toroids (a *really* good selection), a good selection of things like Plate chokes for BA rigs, and miniature pots for things like your HT. One other thing he has is a good assortment of knobs which might be of interest to the BA folk. He might also be a source for BA transformers.

The prices were quite reasonable. A lot of stuff was much less Electronics Part Outlet here in Webster.

He even has speaker grill cloth which I hadn't seen anywhere in *years*. (each of my 3 children has, at the age of 18 months, destroyed a speaker).

all in all a good source for some of the off the wall stuff.

For about two years now, I've been working with Kent Ogletree KD6NHP
to produce a series of 6M modules based on Motorola parts. We've been
in no particular hurry and haven't published anything yet, but the
first piece will be presented in the next HAMBREW magazine. It's a
cheap 1W final for 6M FM. It's the final amp portion of a project
called the Scanner Companion, which is an extremely simple
single-channel NBFM transmitter with antenna and power switching,
designed to hook into any scanner covering the 6M ban. The scanner
plus the Companion form a complete single-channel transceiver. The
Companion should be in an upcoming issue of HAMBREW.

The next generation, which we're calling the 96er (a Nineties Sixer,
anybody get the reference?) is a 4-channel complete NBFM transceiver
including receiver, with MCW for code practice. The power output is
unclear and depends on what sort of final amp we perfect in the next
couple of months. I don't know where it will be published yet, nor
when it'll be finished.

After that we're working on Deep Six, a DX-quality multimode
synthesized 6M radio. The nature of the synthesizer is a BIG issue,
and we're having similar difficulties. Kent is playing with DDS
schemes along the line of some of the things published in QST over the
past year, most recently in March.

One insight that might be useful is that the MC3362 was intended for
cordless phones, not killer ham gear, and it probably works as well as
it needs to. You might experiment with the MC13135, which is the
MC3362's improved successor, and available for $7.95 from DC

Electronics here in Scottsdale. We have a 4-channel crystal-controlled receiver underway using that chip, which is a considerable improvement in many ways over the 3362, which is not being manufactured anymore as best we know.

Another interesting notion I had is to use the MC145166 cordless phone dual-loop synth, which provides two groups of ten channels at 46 and 49 Mhz, with only a single 10.24 Mhz crystal. My calculations show that by replacing the 10.24Mhz crystal with one of the common 11.0592 Mhz crystals, the divide values on ROM inside the 145166 move up entirely within the 6M band. The big snag is that the first IF moves up from 10.7 to 11 something as well, making the canonical crystal filters unusable. But an LC filter for the first IF is not unthinkable, and I'm going to see if the common 10.7 IF cans have enough tuning slop to get up that high. Two of those back to back with some impedence matching should give enough selectivity for the first IF unless your in downtown LA or somewhere. Out here as with most of the country, 6M is pretty dead.

What you'd have then, basically, is a cordless phone on the 6M band, with however much power you want to hang on the end of it.

Good luck with your project. I'd certainly be interested in hearing from other people who are playing around with Motorola's terrific 49Mhz parts and RF finals.

>Ok this may be an incredibly dopey question but what if any are the physical
>differences between Transmit and Receive Crystals? IOW can a TX Crystal be
>used to Receive and Can a Receive Crystal Transmit? If no why?
>Thanx folks.....Electronics novice am I.

Not so dopey at all. Transmit crystals operate on the frequency that eventually gets out of the antenna, or some submultiple of that frequency. For example, a 17.5 Mhz crystal can generate RF at 17.5 Mhz, or you can triple the frequency to 52.5Mhz to operate on 6 meters. (You can double it, or multiply it by some other integral value as well.)

Receive crystals do NOT work on the transmit frequency. They are offset by a certain frequency to facilitate mixing with the incoming receive signal from the antenna, and conversion down to an intermediate frequency for amplification and eventually detection. In most VHF FM work, the receive crystal is offset from the transmit frequency by 10.7 Mhz. When you mix that offset crystal frequency with incoming signals, you get (along with some other combinations) a difference frequency of 10.7 Mhz. This frequency is passed through a narrow bandwidth filter that passes 10.7 Mhz signals and blocks all others. On the output of that filter you have your desired receiver signal, and nothing else. (All of this is an ideal case, of course; there's always "slop" in systems like this.)

An example: My 6M receiver uses a receive crystal with a frequency of 41.825. (52.525 - 10.7.) In the first mixer, this 41.825 Mhz frequency is mixed with incoming signals from the antenna, with the result that the signals coming in at 52.525 (the 6M calling frequency) appear at the output of the mixer at 10.7 Mhz. This 10.7 Mhz mixer output is then filtered, processed further, and detected, allowing me to receive on 52.525 Mhz.

So receive and transmit crystals do not operate on the same frequencies and are thus NOT interchangeable. A transmit crystal may be used in a receiver in some cases, but it will NOT receive the frequency stamped on it, but at some offset from that frequency, probably 10.7 Mhz up or down. (Other offsets in common use are 455 Khz and 262 Khz, but generally not in crystal-controlled receivers.)

Hope this helps some. Best way to understand this stuff is to build some of it yourself!

Can't help with the printer, but most any flatbed plotter will work. Just put resist ink in the pen and plot the board. Be careful that the plot is exactly 1-1 or things won't fit. Most CAD programs have a means to calibrate the plot dimensions. I use a Tektronix 4662. Had to write a translator to take HPGL and convert it to TEK codes. Have used AutoCad and PADS-PCB.

Hello:
I have an older Yaesu FT-530 that's about 3 years old
and its one that only took the solder pad 13 mod. My question
is that it will only transmit up to about 456.000mHz but at
that freq it flutters at keyup, its quite about 454.000mHz.

Does anyone have any suggestions to get the unit to
transmit up to 470.000mHz. I did the same mod on a friend's
530 and his will transmit up around 470.000 to my jealously.

I have permission to use a 460 business band repeater,
and would like to be able to do so with the 530.

I think the 530 is a excellent radio and hate to see them
discontinue it. Any help with my mod will be appreciated.

Thanks for reading this!

I do my boards by printing with a laser onto mylar film, the stuff
people used to do drafting on. It makes a big difference having a
high resolution laser. 600dpi works very well. Print it out so that
the toner side will be against the board and expose to the UV to cure
the resist. It seems to work very well and is sharp enough to make
surface mount boards with.

Tom,

I tried the URL's listed and also got an error message.

I then shortened the URL to http://www.hth.com/ and got the High Tech Horizon's On-Line Catalog. Unfortunately it is only in Swedish.

73, Harry, W3IIT

2302. All band antenna.

Newsgroup: rec.radio.amateur.homebrew

Titusville, FL. 32796
Voice/Fax 407-267-0353

Oct, 19, 1995

THIS IS THE DRUG (MEDICATION) PRESCRIBED FOR "BASIC PARINOIA".
ITS SUPPOSED TO BLOCK TV AND RADIO FROM STEALING A VIEWERS
THOUGHTS. IT DOES NOT SEEM TO WORK AT ALL. THEY CONDITION
CONTINUES AND THEY USED THE "DRUGGED" THOUGHTS.

THORAZINE
^^^^^^^^^
USES: Treatment of severe anxiety, serious mental disorders,
nausea and vomiting;

TAKE:

FOOD-DRUG INTERACTION: May take on empty stomach or with food/
milk. Do not take with caffeine (Coffee, tea, cola, chocolate)
May increase appetite. If constipation occurs use high fibre/
brand foods. Use foods rich in riboflavin (vitamin B3) or
multiple vitamin supplement.

Cautions: Inform physician if allergic to other major tranquilizers
if taking sedatives, antacids, anti-epileptic drugs, or Ismelin,
or if you have a bone marrow disorder, glaucoma, heart disease, an
impaired liver or an enlarged prostate gland. Avoid during
pregnancy if possible. DO NOT DRIVE if drowsiness, dizziness or
blurred vision occurs. Avoid use of ALCOHOL. Avoid excessive sun
(skin sensitivity). Report for tests as directed. Take full
prescribed course with or without food. DO NOT STOP TAKING
SUDDENLY.

SIDE EFFECTS: MUSCLE SPASMS, TREMORS, INVOLUNTARY MOVEMENTS,
FEVER, SORE THROAT, YELLOW LIVER, JAUNDICE, FAINTING, Drowsiness,
dizziness, blurred vision, fast heart beat, nasal congestion,
swelling of breast tissue, difficult urination, constipation, rash,
discoloration of urine.
THORAZINE CAUSES IMPOTENCE.

This drug causes a person to feel like he wants to jump out
of his skin. Sleeplessness, and loss of sex drive and sensations.
Effects of swelled tounge, and rocking back and forth. Stiffness
of body.

Thoughts are being robbed and broadcast through time
as well as persons all around the Country HEARING what we think.
When they ALL KOOK, and go on a rampage this DRUG is administered.

If a Radar Jammer would do the same thing... why can't we
get some attention, and get one?

2304. Re: How can I print directly on PCBs?

>steps if I can eliminate that.
[zap]

Greetings. For those looking for a way, there are really three pointers: (+ one for front panel jobs)

1) See the PCB FAQ, I keep a copy at URL:
http://www.paranoia.com/~filipg/HTML/FAQ/BODY/F_PCBfaq.html

2) I used to be into doing this at home, so I have a Home PCB faq at URL: (see Press-n-Peel - best stuff!)
http://www.paranoia.com/~filipg/HTML/FAQ/BODY/F_Home_PCB.html

3) My boards are 2 layer and lotsa plated holes so I have them done by hobbiest-friendly PCB places, a dated list at URL:
http://www.paranoia.com/~filipg/HTML/FAQ/BODY/F_Commercial_PCB.html

4) For those who want to try their hand at a fron panel as well, there is a Decals FAQ at URL:
http://www.paranoia.com/~filipg/HTML/FAQ/BODY/F_Decals.html

Take care.

P.S. Now that the Repair pages are in good shape, see URL:
http://www.paranoia.com/~filipg/HTML/REPAIR/
I will be reworking the above. Lotsa work. Input welcome!

Is this the best newsgroup to monitor for QRP info? I'm just getting into some of the kit built stuff and would like to monitor QRP related info...

I just built the NorCal 40A kit and like it, but would like to hear opinions from more experienced folks (since this is my first kit, I don't have a large range of experience to draw on).

Also, since the kit is so small, I'd love to get info and hear discussions about small, low power, antenna tuners and power meters (maybe even small enough to fit inside the NorCal 40A case??? [2.5 x 4.5 x 4.5 approx half occupied already]). Is an antenna tuner really needed anyway if I use a 40 m dipole?

Tnx,

Marti Sawyer

I understand than an atomic bomb will produce a LARGE electromagnetic pulse which can "mess up" most radio communications gear (likely including cassets, CD players, computers, CB radios <grin>...you name it).

This may also slow down traffic in you neighborhood.

>that causes low-level-modulated AM to sound bad.

It *can* be IMD in the linear amplifier too, however. The linearity
requirement for acceptable sounding SSB is less than that for acceptable
sounding AM. And phase distortion of an SSB signal is almost inaudible,
but it is *horrible* with AM because the recovered audio is a product
of both sidebands and the carrier. If the sidebands have differential
phase, it will be blatently obvious in the recovered audio. You've heard
this, it is called selective fading when the ionosphere does it, it's
just called bad audio when the linear amplifier does it.

Linear amps *can* be linear enough, but you can't *assume* that they
will be just because they work acceptably for SSB.

>High-level modulation of a transistor final is much more complicated
>than just lifting a leg of a transistor and sticking a transformer
>in the circuit.

Yep, that's true, but it's not *that* much more complicated.

>If I ever want to try this, I'm definitely going to start with a 50W
>CB pre-driver and hack on THAT, rather than mess up my main rig.

Ugh. You *can* just use your ham rig in CW mode with reduced carrier
output to drive an external class C stage that you "plate" modulate.
Actually today I wouldn't do that. I'd run the external stage Class D,
and vary the switching duty cycle to modulate it. That's the way some
of the modern broadcast transmitters do it. Lots more efficient, and
sounds clean too if you do it right, IE switching repetition rate well
above the Shannon limit and a reconstruction filter on the output.

>When ten meters comes back and I want to get on AM again, I'm getting
>a peak-reading wattmeter so I can adjust my transmitter properly.

Wrong tool. You need a modulation monitor scope. Any old oscilloscope
that lets you drive both the horizontal and vertical plates will do.

>There are still some folks out there knowledgeable enough about AM and
>nice enough to lend a hand.

Some of us still have to do it for a living. :-(

>Pete Mcquail, G8DCJ

The difference between the conductivity of copper and silver isn't large,
and it's less at radio frequencies due to skin effect. (The skin depth in
copper is greater than in silver, reducing the advantage.) There was quite
a discussion here recently about silver-plating cavities which addressed
this in detail.

When you have a conductor over a ground plane, e.g., microstrip
construction, nearly all the current is flowing on the bottom of the
conductor and the top of the ground plane, which you won't be able to plate
anyway.

>
>CC/Impulse/N2QMU

I don't think it would have a prayer of working. The passive antenna would reradiate too little signal to have a noticable effect on an FM receiver at a distant location. Remember that the FM receiver has a limiter that saturates on the desired signal so your very tiny reradiated signal would be swamped. Only if you could introduce enough signal to generate significant multipath would there be detectable distortion in the receiver, and that, I'm afraid, would require the receiver to be very close by, IE you could probably holler further than this would work.

OTOH, you have something with the idea of rectifying the signal to use as power for generating another signal, say on the emergency band. That might have a ghost of a chance of working. You need more than a diode though. You need a tuned circuit you can "ring" with the excitation so as to generate a signal on 121.5 or 243 MHz. The signal will be horribly weak, but as we know, even very weak signals can sometimes be detected to surprising distances.

I think I'd be looking for some zinc plating off the wreck, however. Sticking a piece of zinc and a piece of copper into a coconut makes a dandy little battery. *Now* I can start to generate a real signal. Or I'd wind some of that wire around a bit of iron and make a dynamo so that I could crank up electricity to order. Once I've got some power, I can make a nasty spark transmitter that will annoy someone enough to come looking for it.

In the latter vein, if all you can generate is a very weak signal, put it where it'll be the most annoying, where the weakest signals are received. In that regard, be aware of what frequencies radio astronomers monitor.

>how the wires are connected ?, any troubleshooting techniques for the
>meter?, could anybody send me the text or the GIF of the Schematic (or
>both)?, where can I get an old owner's manual?/ book?

The rotator uses a pot for position reporting. Use your VOM to
find the pair of wires that change resistance when you turn the
rotator. That's the pair that go to the meter circuit. To find
the meter circuit connection on the control box, use the VOM to
find the pair of terminals that have a DC voltage on them *when
the rotator is not turning* but the box is on. That's where the
pot connects. The motor winding terminals have an AC voltage
on them when the rotator is commanded to turn.

Now assuming you have things wired correctly, and it still doesn't
work, you may be missing the DC voltage, or the pot may have failed.
Your VOM checks should have told you which has happened. If the
pot has failed, replace it. If the DC sense voltage is missing,
you'd better find a diagram for the control box. Of course you
might just have a break in the rotator cable. Ring that out if
you can before plunging into the innards of the rotator.

>frequency: the crystal likely will oscillate on a fraction (like 1/9 or
>1/12) of the actual transmitter output frequency;

Yeah, if the crystal is for a VHF or UHF rig you can count on this.
If it is for a HF rig, it may operate on its fundamental or an overtone.

>If you are lucky, the crystal may be stamped with _both_ the frequency of
>oscillation and the radio input/output frequency.

Yeah again, but push come to shove you can always rig up a simple
oscillator circuit and *measure* the frequency of the unknown crystal.
If it's an overtone crystal, you'll get the fundamental instead, and
that won't be the frequency or channel stamped on the crystal, or an
exact submultiple thereof. That's a clue, and you can then try it in
an overtone circuit and try to find where it really is intended to
oscillate. Or just use it in fundamental mode if that turns out to
be convienent.

>Ugh. You *can* just use your ham rig in CW mode with reduced carrier
>output to drive an external class C stage that you "plate" modulate.

That's what I meant. I would modify the predriver to go class C, and do
all the other stuff you guys have been telling me about, but do it to the
external amp stage, not my main station rig.

>Actually today I wouldn't do that. I'd run the external stage Class D,
>and vary the switching duty cycle...

I thought about that too, but that's something I need to learn a LOT more
about before I go throwing signals on the air. Thanks. You wouldn't
happen to have a good text to recommend on PWM, would you?

>>When ten meters comes back and I want to get on AM again, I'm getting
>>a peak-reading wattmeter so I can adjust my transmitter properly.

>Wrong tool. You need a modulation monitor scope. Any old oscilloscope
>that lets you drive both the horizontal and vertical plates will do.

If I run across one at a hamfest, I'll certainly pick it up. But finding
one of these working would be more difficult than a peak reading wattmeter.
I thought the latter would allow me to view my 20W unmodulated carrier, then
to speak in a normal voice and adjust my modulation until I could see the
correct peak value on the meter. I would then be able to learn more about
what my final stage could really do before it starts sounding like bad audio.
Also I could get a better idea what my signals were doing when I'm on SSB.

>>There are still some folks out there knowledgeable enough about AM and
>>nice enough to lend a hand.
>
>Some of us still have to do it for a living. :-(

Yes but you still volunteer your valuable advice free of charge to us
lost souls out here floating adrift in SSBland, rescuing us, well never mind.
Thanks again again Gary, and 73,

This indeed could give you the "slimmest" chance of rescue. The very
slimmest. It is possible to receive a radio signal and reradiate it,
(usually in a different direction, as in passive repeaters to get
TV signals over mountains. With a carbon mike, it's even possible
to impose new modulation on top of the existing signal (AM modulation).

But, the problem here, is using the FM bcst band. A small change in
signal strength would not be noticable to a FM listener. Slightly better
chance of making a noticable difference in the background noise level
on the AM band.

I'd use the wire to saw down a few palm trees, and tie them together for
a raft.

If you really want a dual-PLL like the MC145166 but don't want to
have to play games with a "non-standard" IF, you could use the
MC145162, which is very similar to the '166 but is serially programmed
for any frequency/reference up to 60MHz, rather than ROM programmed
like the '166. Admittedly, you'd need a CPU (like a PIC) to pump
the PLL, but then you'd have memories and selectable splits, etc.

If a single PLL is acceptable (which should be just fine for a
half-duplex radio, unlike the full-duplex cordless phones), the
workhorse MC145170 is a good choice, usable up to 180MHz (145170-1).

> But an LC filter for the first IF is not
>unthinkable, and I'm going to see if the common 10.7 IF cans have
>enough tuning slop to get up that high. Two of those back to back
>with some impedence matching should give enough selectivity for the
>first IF unless your in downtown LA or somewhere. Out here as with
>most of the country, 6M is pretty dead.

10.7MHz (and 21.4MHz) crystal filters are so cheap, and the performance
using a crystal filter at the first IF potentially so much better than
using an LC filter, I'd be hard pressed to use anything but 10.7MHz or
21.4 MHz for the first IF.

2320. Sierra QRP rig

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-09 00:00:00 UTC
From: alanb@sr.hp.com
Message-ID: <4keddv$4t8@canyon.sr.hp.com>
Source record: 106151

Here's a copy of an article I recently wrote for the local ham club newsletter:

Review of Wilderness Radio's Sierra transceiver

by Al Bloom N1AL

The Sierra is a CW (Morse code) QRP (low power) transceiver kit. I bought it to use camping while on long-distance bicycle tours. For that purpose, I wanted a small, lightweight radio with low power supply current drain. The 2.8 x 6.6 x 7.0-inch Sierra weighs about 1.5 pounds, and draws only about 35 mA on receive. I plan to power it from a string of 8 AA penlight batteries.

You change bands by plugging in different band modules. The cabinet opens with a pair of quick-connect latches, making access to the band module connector easy. Besides eliminating the need for complicated band switching, this method allows you to pay for only the bands you need. Band modules cost $31 each.

I was favorably impressed with the design. With some other ham radio kits I have seen, one look at the schematic was enough to convince me that I didn't want to operate (much less purchase!) the radio. The Sierra, on the other hand, has a well-designed superhet receiver with a 4-pole crystal filter (with adjustable bandwidth 150-1500 Hz), stable VFO, RIT (receiver incremental tuning) and audio-derived AGC. The 2-3 watt transmitter has solid-state T/R switching, which allows any desired break-in keying delay by changing one capacitor.

The hardware is also well thought out and uses good-quality components. The main PC board uses plated-through holes for reliability and is extensively silk-screened to make it easy to locate components. The front and rear panels are also nicely painted and silk-screened, making an attractive enclosure.

The manual is excellent. It leads you through the construction and alignment process, describing how to identify components and pointing out possible pitfalls. I would rate this kit as "moderate" difficulty. Anyone who knows how to solder to PC boards and has at least a little experience building kits or other electronic hardware should have no trouble.

With most kits, the most time-consuming job is wiring up the connectors and cable harnesses. With the Sierra, there are no

connectors or cables to wire, since all components, including the controls and connectors, mount on the main PC board. The most time-consuming job is winding the toroidal coils. It took me less than 8 hours to completely assemble and test the main unit and one band module. I received the kit in the mail on a Monday and worked JE1*** (Japan) on 40 meters Tuesday night.

Each band covers 150 kHz. Available bands include 80m (3.5 MHz), 40m (7 MHz), 30m (10 MHz), 20m (14 MHz), 17m (18 MHz) and 15m (21 MHz). The manual also includes parts information to build your own 160m (1.8 MHz), 12m (24.8 MHz) and 10m (28 MHz) modules. Band module PC boards with hardware but no components are available for $9.50.

This radio is designed to be modified. Several possible modifications are mentioned in the manual, and there is plenty of blank front and rear panel space, and space inside the cabinet, to add your own gizmos. I plan to add an S meter, power/SWR bridge, front-panel bandwidth control and keyer.

The optional KC1 keyer kit ($45) is a tiny (0.8 x 2.5 inch) PC board that interfaces to solder pads provided on the Sierra main board. Construction is a little trickier than the Sierra because of the close-spaced components and PC traces. You'll have to drill your own holes in the front or rear panel to mount it. It has up to 4 memories for pre-programmed messages. It also includes a frequency counter function, adding digital frequency accuracy to your Sierra tuning dial. Readout is via Morse code!

I haven't had much time to operate the radio yet, but it seems to work beautifully. The receiver performs like a "real" ham radio and is infinitely better than the direct-conversion designs common on some older QRP transceivers. The 3.085-2.935 MHz local oscillator is stable. The main tuning dial includes an 8:1 gear-reduction drive, making fine-tuning easy. Dial resolution is 5 kHz, with typically +/- 1 or 2 kHz accuracy.

Wilderness Radio is a new company that seems to specialize in repackaging Northern California QRP Club homebrew projects as kits. In addition to the Sierra, they also offer a 40-meter-only QRP rig called the NorCal 40A for $129. Several of these were successfully built in our local ham club's construction class with good success.

Cost: $245/$269/$295/$369 with 1/2/3/6 band modules. Wilderness Radio, POB 734, Los Altos CA 94023. (415) 494-3806 (9AM-6PM).

2324. Replacing SOIC & TSOP devices?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-09 00:00:00 UTC
From: cyamamot@kilroy.jpl.nasa.gov
Message-ID: <4keo3m$b5q@netline-fddi.jpl.nasa.gov>
Source record: 106155
Cross-posted to: sci.electronics.repair,rec.radio.amateur.homebrew

Greetings,

Does anyone have any experience or techniques they can share about replacing surface mount IC's such as SOIC's and TSOP's?

It seems easy enough to remove once the correct tip is purchased, but what is the best way to solder it back in? Which method will achieve the best "as-new" appearance?

- Fine tip pencil? (Can be done but you need steady hands and connections don't look consistant - as done by machine)
- Small butane torch? (I'VE NEVER TRIED)
- Static-free hot air? (I'VE NEVER TRIED)
- ? ? ? ? ?

I have replaced SMT transistors and 8-pin SOIC's using my plain ol' Weller pencil using a 1mm tip with good results. Only thing is I just can't regulate the exact amount of solder per lead for consistant looking connections.

Now with TSOPs and other finer pitch packages with 0.5mm lead spacing, I can't use the ol' Weller anymore so I'm looking for other means. Any suggestions from those who've replaced SMT devices would be appreciated.

Thanks,
- Cliff

2328. QRP 2m Transmitter plans??

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-09 00:00:00 UTC
From: paul_butterfield@wb.xerox.com
Message-ID: <NEWTNews.829066088.18276.Pbutterf@butter-pc.ess.mc.xerox.com>
Source record: 106159

Home brew crew,

Can anyone suggest inexpensive plans for a low power ~100-500mW 2m transmitter? The application is a hidden transmitter for a fox hunt. A single frequency (146.565 MHz) FM signal is required. Input signals for PTT and audio will be provided by my CW memory keyer (CMOS Super Keyer III from QST/Idiom Press).

I know I could use an HT for this application, but I would like to construct an inexpensive set up I could give to our club for use in future events without risk to my personal radio collection ;-). Best I've found so far are hundred dollar kits from Ramsey or Hamtronics; I might as well buy an old rockbound xcvr at a hamfest.
Any pointers to appropriate plans?

-Paul

The FM broadcast system has such big margins that he wouldn't be
noticeable. If it can cope with large aluminium structures that
fly through the air (read: commercial passenger jets)...

If he wove it into a corner reflector, a ship or airborne radar could
pick it up as a brighter spot.

2332. Re: Fairly direct plotting of PCB s

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-09 00:00:00 UTC
From: "Charles R. Patton" <patton_c@a1.wdc.com>
Message-ID: <4kcb1g$3ch@gatekeeper.wdc.com>
Source record: 106226

A small addition to the direct plotting idea. In the old days (maybe 25 years ago), I wanted to make some etched circuit boards. I didn't know then what I know now! So I went to a photoengraver and asked him how he does his process. It was as you described and as many a silk screener has learned, Poly-vinyl choride (white glue) or albumin (egg white) with potassium dichromate. Unfortunately these are not good circuit board resists. In silk screening they work because the paints are solvent (non-aqueous) based and essentially don't attack the resist. When the photo-engraver did his magic, he developed the pattern on a zinc plate. Then he dipped the developed pattern in chromic acid (as a hardening agent) then he heated the zinc plate until he changed the resist to a dark chocolate brown. At this point the resist would withstand hot ferric choride or nitric acid (I don't remeber for sure which.) The stuff (resist) had to be removed with abrasives! When I tried to duplicate the heating step on circuit board, the PCB would de-laminate as the temperature required was too hot. Then I learned that PCB resists work by using a solvent (non-aqueous such as tri-chlor) based component which in negative working materials will harden on exposure to light. Thus when used in aqueous etchants such as ferric choride, the etchant has no solvent effect on the resist. The resist is then removed by using a more aggressive solvent such as MEK.
So I'm not sure how you would apply your idea to provide the hardening agent to solvent based systems. However, as I recall you can thin laquers or tar based paints and use them as the ink in a pen and do a direct plot on a PCB and then go direct to etch.

Portable AM/FM/SW radio needs no batteries, uses clockwork generator
Designed for outdoors, emergencies, isolated areas
South African BayGen Freeplay radio makes US debut

Seattle, WA - April 9, 1996-- A lunch-box sized portable radio that requires no batteries or outside
power source makes its US debut. The BayGen Freeplay radio, introduced to Africa last Fall, is now
available in the United States. Built by BayGen Power Ltd. of Cape Town, South Africa the radio,
powered by a clockwork generator, can play for 40 minutes on one 30 second windup. The portable
AM/FM/SW radio is useful for campers, vacation cabins or emergency home use. The BayGen
Freeplay radio is available now for $149.00 from Windup Technology, Inc., 1-888-946-3871
(1-888-WINDUP1) or 206-783-2880. E-mail: 74301.2203@compuserve.com.

The BayGen Freeplay radio, invented by Briton Trevor Baylis, is powered by
a wind-up spring that turns an internal generator. This method, used in the Gramophone decades ago,
has been modernized with new materials and
computer technology. The radio, currently in production in Cape Town, has the backing of South
Africa's President Nelson Mandela and is endorsed by 20 aid and relief agencies.

Charles Lukey, President of Windup Technology, Inc.: "The Winter of 1996 was one of the worst in
US history. Millions of people turned to their battery powered radios after the lights went out - many to
discover the batteries had gone dead.. The BayGen Freeplay radio is ready anytime."

Operating the three-band radio is simple. Turning a crank for 30 seconds provides enough electricity to power the radio for about 40 minutes. The generator will last for about 10,000 winds. The US version of the radio comes with a DC adapter for wall socket convenience and retails for $149.00.

The radio also appeals to those concerned about the cost and disposal of batteries. A comparable AM/FM radio would require over 400 "D" cells to match the BayGen Freeplay's minimum rated generator performance of 6600 hours.

The BayGen Freeplay radio is BayGen Power's first product. Other products currently in development include a windup flashlight and a windup Walkman-style radio.

For information on the BayGen Freeplay contact: Windup Technology, Inc., 7012 22nd Ave NW, Seattle, Washington, 98117-5625. Toll Free: 1-888-946-3871 (1-888-WINDUP1) or 206-783-2880. E-Mail: 74301.2203@compuserve.com.

Hi there. If you want a really GOOD small portable shortwave receiver for WWV (or anything else), the I highly recommend the Sony ICF 7600G (available from Grove Enterprises for near $200). It covers long wave, medium wave and shortwave (150 Khz to 30 Mhz), with digital readout and keypad entry, scanning, SSB capability, and Synchronous detection, along with standard FM broadcast (stereo with headphones). It is quite sensitive, and fits very nicely in my eyepiece box. But if you are going to use it with an A.C. adaptor, get the Sony version, since the DC input jack is not standardized.

This is an interesting method, Lyndon. I thought that heat was was
required to tranfer the toner from the mylar to the copper
side of the board. Please elaborate on your method.

It is not very likely that someone will have odd frequency crystals
like these laying around. Your best bet is to order them from
someone like International Crystal. These folks probably have the
details of the radio you are trying to modify on file and can make
the correct units for you. They are not too expensive either.

Good Luck

I ground a lot of crystals in my Novice days, but I never heard of this. Makes sense though - the crystal generates a voltage under stress, and it stands to reason that it might emit its natural frequency during the grinding process. The only thing I would wonder is whether the liquid coating the crystal might not reduce its frequency somewhat while you're actually grinding it. Neat idea though!

Incidentally, its usually not possible to move the crystal too far without a considerable reduction in activity. I ruined a lot of FT-243 crystals like that. :(

>the best "as-new" appearance?

Flux the board, then solder the part in place quickly with the
sloppiest tip you've got. Don't worry about shorts or (within
reason) using too much solder. Let the part cool, then go over the
leads with *fresh* solder wick. Don't heat all the leads at once or
the part will lift off the board and you'll have to start over. Also,
make sure your iron is hot enough to get on and off the leads quickly
with the wick.

When you're done, wash the residue off and the part will look like it
hasn't even been replaced. :)

From: Peter Shintani <shintani@tv.sony.co.jp>
Message-ID: <4kfasp$kt5@oskgw.osk.sony.co.jp>
Source record: 106173

Hi:
Does anyone have any experience with the Motorola HF linear amp
applications ? I am considering to build a HF linear, and would
like to know more about the applications. For example, in addition
to the hints given in the application guides, are there other
important matters to consider ? Ie parasitic oscillation,
how to switch the external LPF's, what order of LPF are
required ?, how to switcht the LPF'S, ETC.
At the moment I am thinking of building something in the 600 W
class. (Should I go for MOS or bipolar ? which would
be more cost effective over all, including the cost of
the PS ? Mobile operation is not a consideration)

He's using UV-sensitized resist-coated boards. Different process from the toner-transfer method. It's what we did before there were laser printers.

You can buy these boards pre-sensitized (packaged in black bags) or you can buy spray-on resist in aerosol cans. On exposure to light, theresist hardens. Unexposed resist washes off with water.

This method works when you have reliable sunlight -- winter time is not the best. It also works better if you sandwich your sensitized PCB and mylar under a piece of window glass, or use a contact frame.

The "official" instructions say to use UV-spectrum photo flood lights in a light stand, because you can have more consistent control over light intensity and duration.

> only.

What, exactly, do you mean by "all-band"? The ham spectrum extends from 1.8 MHz through the microwaves. For ALL of those bands, it's not really practical to speak of one antenna. A discone is a very good antenna, but tends to be physically very large for the MF/HF bands, but very practical for VHF/UHF. For HF "all-band" coverage, you might want to consider a trap dipole, or even a tuned wire, depending on your installation/resources/needs.

I have a question.

Before I commence work on a 18mhz - 22mhz receiver for monitoring Jupiter, can I simpley modify the filter section of a Ramsey shortwave kit for this range. I have not yet seen the kit nor the schematic, I have however looked over the 118-136mhz receiver they have for aircraft reception. I believe they may be using a similar circuit based on the Signetics frequency converter (NE602). Any information would be helpful. I'd rather make modifications to an existing receiver then build one from scratch, however, I'm not opposed to doing so... Any thoughts, or ideas would greatly be appreciated...

Thanks,

Gary-

One method that I have used that I've never seen mentioned is using an
HP single pen flatbed plotter with a sharpie mounted in place of the
std pen. The ink from a sharpie will resist the etch.

The method Lyndon described uses the photo sensitive board method.

2368. homemade acoustic coupler

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-11 00:00:00 UTC
From: bk720@FreeNet.Carleton.CA
Message-ID: <4kis6g$6pg@freenet-news.carleton.ca>
Source record: 106096

Is it possible to build a cheap acoustic coupler for
computer modem use?
My situation is I have a cell phone in a cabin with
power but no phone lines.

Since cell phones are smaller than regular phones,
a normal acoustic coupler will not work (plus they
are expensive).
Would it be possible to run separate small mikes
from each, speak and listen ends of the phone
(each mike would be covered with some kind of
elastic soundproofing material I guess) and
run these two separate lines sever feet away,
amplify them and receive these signals into
separate corresponding ends of computer modem
line jack?

I don't think I have written this very clearly.
The computer talks through a phone line via
a modem and phone line jack.
The phone line jack must have wires for sending
and receiving audio.
I am looking for a cheap homemade solution to
this.
Perhaps if I ran the two mike wires to small
speakers which were placed on a regular sized
phone receiver, then ran the phone jack from
it into the computer.

any comments on this

>I am looking for a source for 2N2156 transistors.
>If these are unavailable what would be an equivalent?

The 2N2156 is listed in my NTE and ECG Semiconductor cross
references as a PNP, Germanium, high power, high gain amplifier
transistor. It crosses to an NTE213 / ECG213.

I haven't seen it, but ARRL is selling a CD Rom that is supposed to contain the entire contents of the QST, QEX, and (I think a contest journal) for the year. I believe that the price is $19.95. Sounds like a good way to archive the year, without taking up a whole bookshelf.

2371. 4-1000A amplifier on 2 meters?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-11 00:00:00 UTC
From: wlfuqu00@service1.UKy.EDU
Message-ID: <199604111606.MAA12814@service1.cc.uky.edu>
Source record: 106099

I have been looking over the specs for the 4-1000A and the 4PR1000 tubes and
was wondering if anyone ever used one around 144 MHz. I am currently working
on a HF amplifier and need to build a 2 Meter one as well. The specs for
these tubes are good for up to 110MHz but at higer frequencies they are
screen grid neutrlzed by using a series adjustable capacitor to ground. If
they have too great of lead inductance this may not work.
A 4CX or 3CX series tube would obviously be a better choice but I thougt
it would be intersting to make one with a tube that glows.
Please let me know if you have seen anything in a magazine or know anyone
that has had some success in doing this.

This is a standard industry technique that we use here at the Hewlett-Packard
Santa Clara Division in our crystal fab. The part about listening with a
radio receiver works just like you describe. Of course, we have "slightly"
more sophisticated grinding methods than you are using. For instance, we
hold the grinding angle to about a 1/1000 of a degree.

You might replace your Comet abrasive with the cerium stuff they sell at
lapidary supply stores that is used for polishing decorative quartz.
Also, after grinding, you should etch the quartz in hydroflouric acid.
If you don't, the quartz may disintegrate over time due to microscopic
cracks that grow. This actually happened to early WWII vintage crystals.

Bill,

The internal leads are too long. The 4-1000 is barely usable in the FM
BCB, and difficult to use at 30 MHz.

Stay away from it if you have other choices, even for HF work, if you plan
on using it above 20 meters. They can be made to work, but they can be
headaches even on ten and fifteen.

Source record: 106111

I just read an article that briefly described the use of SAW (Surface Acoustic Wave) devices in simple, low-cost RF transmitters. Apparently, they are available both as filters and resonators, for frequencies in the hundreds of MHz.

I'm interested in short-range RF data transmission via simple, inexpensive links, and these seem like they might be a good alternative to the LC circuit's stability problems, or the complexity of crystals with frequency triplers, etc. I was also wondering if the SAW resonators are pullable, for FM or FSK transmission schemes?

If anyone can help with info on Manufacturers and Data Sheets, Distributors and Application Information, I would be very interested. Thanks!

>
>Glenn Sparks KI5GY

I used that method years ago, and found that every time the plotter lifted the pen, or put it back down, I got a void in the trace due to not enough ink in that area.
I never could get around the problem . Solid fill areas looked like a photograph of a farmers
field taken from an airplane. If someone has made this work, I would like to hear about it.
I did however borrow the plotter idea to build an X-Y-Z drilling machine to do my ECB drilling.

I have had much better luck since adopting the laser toner method
(fused to the board with a tee shirt press).

Good Luck everyone,

LHI POCSAG Decoder

Pager data stream monitoring unit

L0pht Heavy Industries is proud to announce the release of our POCSAG monitoring unit. Used in conjunction with a radio scanner or receiver, it allows off-the-air decoding of POCSAG paging signals at 512, 1200, or 2400bps. Both numeric and alphanumeric messages will be decoded, as well as a hex dump of raw POCSAG codewords.

This system is useful for the testing of paging systems and transmitters. With the included software, one may reject or log to disk specific pager capcodes, making it easier to track only the necessary signals. The device is powered off a PC-compatible serial port and is extremely small - handy for portable use.

The unit is available in both kit ($59.95 + s/h) and fully-assembled ($89.95 + s/h) versions. All components, schematics, software and documentation are included. Fully-assembled units are tested before shipment. General soldering and electronics knowledge is required to construct the unit from kit form, so please be aware when ordering. LHI is not responsible for any results, good or bad, produced by the user during use or construction of the product, so consider the assembled-unit if you are not confident in your assembly skills.

Name: _____

E-mail Address: _____

Mailing Address: _____

_____

Amount Enclosed: _____

To:

POCSAG Project Division
c/o L0pht Heavy Industries

P.O. Box 990857
Boston, MA USA 02199-0857

Please include $59.95 for kit-form or $89.95 for fully-assembled unit plus $5.05 for shipping and handling in United States currency for each unit ordered. We will ship all orders via First Class United States mail to anywhere in the World. Cash, Check or Money Order accepted, sorry no Credit Card orders. Please make all checks payable to L0pht Heavy Industries. Massachusetts residents please add 5% sales tax. Please allow four to six weeks for delivery.

L0pht Heavy Industries (L.H.I.) assumes no liability for lost or misdirected mail. LHI reserves the right to refuse sale of this unit to any person, organization or entity. All sales are final.

Any questions can be directed to pocsag@l0pht.com

2392. Professional looking front panels - how?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-12 00:00:00 UTC
From: fbures@alchemy.chem.utoronto.ca
Message-ID: <Dpr0x0.67G@alchemy.chem.utoronto.ca>
Source record: 106030

I am soliciting an advice on how to create professionally looking front panels of electronic devices.

Over my 37 years of both amateur and professional prototyping I tried all kinds of technologies, none of them with the results I want. E.g.:
Letraset: Too time consuming, very difficult to keep equal spacing between letters, inability to create graphics.
I even tried PnP Blue to transfer front panel images printed on a laser printer. It works _very_ well on Vector aluminum front panels. I does NOT work at all on sand blasted panels or pre-painted panels. The toner simply would not stick.

I would very much appreciate any advice on how to create silk-screen-like panels.

Thanks

2393. Re Printing to copper boards

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-12 00:00:00 UTC
From: Steve Clements <steve.clements@amigabee.posnet.co.uk>
Message-ID: <960412201800107080@amigabee.posnet.co.uk>
Source record: 106031

Hi There

I came across this today at work...

There is some special "paper" you can buy, that you can print your artwork
on with your laser printer (yeah right I got one) or from a copy on a quote "high end copier".

You then iron the paper onto the clean copper (Or use the machine that looks very much like a laminator) to roll and heat it on for you. (Small pcbs OK with iron, quote) The paper and copper clad is is then immersed in
water for about a minute to dissolve the water based adhesive, leaving you
with a etch ready board.

Cost of paper (from this source anyway) is 19 UK pounds for 10 sheets letter size.(Presume this means A4)

Their machine for rolling on the paper for bigger boards is 290.

In my experience, you can't beat engraved lettering. For small panels, you might try locating a maker of signs, badges, etc and having a overlay panel made out of plastic laminate. It comes in various thickness and colors, resists fingerprints and the lettering sure doesn't wear off. I have done this on my smaller projects, keyer, speech processor and so forth.

If the engraver has a big enough setup, he can directly engrave aluminum panels. If you protect the already painted surface with thin tape (mylar, etc) you may get away without re-painting the panel. If not, figure on repainting and then filling the lettering with either paint sticks (messy) or hand filling with India ink in a drafting pen.

I know this can get expensive if you don't have access to the equipment, but it is very professional looking and permanent.

I am in the process of switching internet connections, so for a few days I receive this newsgroup on both AOL and Netscape.

The strange thing is, that the messages I receive are different. Some arrive only via one connection, some via the other, and some on both, but often at very different times, sometimes a day apart.

Can anyone explain this?

This is a very old transistor, I doubt it's in production any more.

I found it's specs in an old (1974) Motorola data manual and they may help you locate a sub. It's a PNP Germanium power transistor in a TO-36 (doorknob) package. Maximum Collector-Emitter voltage is 30VDC. Maximum collector current is 30 Amps. The nominal hFE (beta) is 105 at 5 Amps. It's rated for a maximum heat disipation of 170 watts. Common emitter cutoff frequency is 2.7kHz (nominal).

Pin-out looking down at the terminal side:

```
----- o - index pin and case
/ o \ 1 - BASE
( 2 3 1 ) 2 - EMITTER
\ / 3 - COLLECTOR, mounting stud and case
-----
```

>From these specs I'd guess it's good for a DC voltage regulator's pass transistor or a low frequency DC to AC power inverter.

Happy hunting and 73

I am completing a review of the 2 meter kit. The basic kit is $200 and an extra $50 I believe for the 35 watt amplifier module which fits on a large heat sink that attaches to the back of the rig.

The finished rig won't have all the bells and whistles of a mobile 2 meter rig.. no scanning, and right now no DTMF mike to go with it.. but it has internal provisions for tones and packet and they are looking to put a matching mike or mike kit out for it.

The rig does have 15 memories, is small and looks very professional (not like a kit) when completed.. does the offset and non-standard offset.

The rig is built in sections and you test each section and get it functional before proceeding.. I love this approach. The quality of all parts is excellent.. the manual is excellent. the original had a couple of minor errors, only one that would cause you desoldering problems.. but they have already done an addendum that caught all the problems I came across.. the Faxed it to me. The support is excellent.. if you run into a problem, you can talk to someone I believe who designed it.. but at least he knows about everything there is to know about the rig.

You only need a standard meter for most of the alignment. I found the alignment process for all sections extremely easy.

I loved building the kit.. it works great and the enjoyment I had building it justified its cost.

It's the nature of the 'Net. In my experience it is very difficult
to find a news feed that is fast and complete. There was a public
server in UK that had an excellect feed, but it is no longer
available as a public resource.

If the server you use appears to have a lot of missing articles, you
should complain to your service provider. It may be fault of the
service they're using (Sprint, MCI etc), but that doesn't relieve them
of the responsibility to provide good service. My ISP has three
separate feeds and we still have the problem. Because many of us
have complained, they are in the process of revamping their entire
feed system in an effort to eliminate slow/missing news.

From: Scott Macmillan <scott@golfmike.demon.co.uk>
Message-ID: <NVuaPDAt6pbxEw1u@golfmike.demon.co.uk>
Source record: 106128

I have a Yaesu FT736R fitted with the FTS-8 tone squelch unit.

I want to mod the radio so it can switch on other equipment
(such as a tape recorder) when the FTS-8 receives a valid tone,
and opens the squelch.

Someone told me to connect a wire to the front panel 'BUSY'
light, and us a transistor to switch a relay. This is almost what
I want, but the busy light comes on even when the FTS-8 keeps
the squelch closed.

Any ideas?

Message-ID: <4kn02v$p1r@castle.nando.net>
Source record: 106034

The 6146W is ruggedized, but the 6146B has increased plate dissipation.
Sooo - use the "W" if you are mobile over rough terrain, but you can get a
bigger signal out of the "B" variety if you are into pushing the amplifier
to the limits. The ratings of the 6146W are EXACTLY the same as the 6146A.

From: Don Wilhelm <w3fpr@nando.net>
Message-ID: <4kn11i$p1r@castle.nando.net>
Source record: 106036

Brings back memories - I have one or two, but I wont part with anything that has a ceramic form. That coil form is 1/2 inch in diameter, and has a winding length of about 1 1/2 inches. I know little about the tuning slug characteristics, but if your goal is to produce an equivalent working model of an old circuit, I would use a polystyrene tube (hollow) and jury rig a way to hold a salvaged tuning slug (from junk IF xformer maybe) inside it. At least that way you would be able to obtain a starting point inductance just from the published number of turns, and once you get the circuit working, substitute a stable coil.

The XR-50 coil form was easy to wind and mechanically stable since there was a locking mechanism on the screw for the tuning slug. The ceramic form was stable with temperature (but I wouldn' vouch for the temperature stability of the tuning slug).

Hope this helps,
73, Don

Use the overhead transparency material in your laser printer to make a
full-sized panel overlay with all the lettering properly placed.
Cutout holes and trim appropriately.

Place the above transparency over your (light-colored) front equipment
panel.

Place a pre-cut pre-drilled one-sixteenth acrylic cover over the
transparency and fasten all together with decorative-head screws.

Not that it would have anything to do with the
particular one you're chasing, but just to show how
things are here down under, Dicky's has a stereo
TV receiver kit that uses a Murata tuner. Appears
it's just an ordinary everyday vhf/uhf tuner with
preset voltages (external) to tune it, like what
you'd expect in a vcr. One I got in a kit was
stuffed. Dicky replaced it, no sweat, but they
had it listed in their spare parts cat at >>>$A110+ !!

Oh, good, associated with a chemistry department...

OK, try this: Create the panel blank from aluminum. Put the finish you want on it. I suggest a sanded finish, but if you insist on sandblasting, that's OK. Get the panel anodized and dyed the color you want. Black works well for me. Coat the panel with photoresist; I use Shipley AZ-111S, which is probably very similar to what comes in the little hobby spray bottles. It develops in 0.3M NaOH, which happens to also etch the anodize layer off of aluminum. Create your artwork; you can get a good quality 1:1 negative made by most litho shops. Expose the panel through the artwork and develop the image. I put little "puddles" of developer on the areas I know have image. Where light struck the panel (with "positive" photoresist) is where the bare aluminum gets exposed.

If you want to see examples of this, if you can find a db Systems preamp or tone control box, it will have a panel on it that I most likely made.

If you want to get fancy, you can develop the image and bake the photoresist on and run the panel back through another anodization step, dying the lettering a different color, but you are on your own with this!

I've found that 2024-T3 alloy works best for dark blacks that are a thin layer (and therefore easy to get very clean graphics etched into). However, VERY few anodization houses can do a good job with it! Too bad.

This technique works best for aluminum-colored graphics on a dark background. You can also get special photosensitive graphic arts films from art supply houses. Some have an adhesive backing; you just stick them to your panel. Various color combinations are possible. I'm pretty sure 3-M is a manufacturer of such stuff.

Source record: 106043

-- Can anyone out there help me out with this? I want to order some
fundamental frequency crystals to use in a variety of tube-type
80m and 40m CW transmitters of the two stage variety. I gathered
the schematics for these as-yet unconstructed rigs from 50's and 60's
articles in QST magazine.

These simple rigs generally run about 350 VDC to both oscillator and
amplifier. The plate input ranges from 10W to 35Watts at the amplifier.
The oscillator stage in most designs is a Pierce or grid-plate type.

I received a brochure from Jan Crystals in the mail. However, I am
not technically knowledgeable enough to know what to specify. I do
know that these older designs subjected the crystal to more stress, if
that is the correct word, and that the crystal could be fractured if
it is not made to the correct specs.

In the articles I gathered, they refer to the crystal required as
simply a fundamental frequency amateur crystal. Jan offers an FT 243
mount amateur crystal, described as: 32pF load capacity, + or - 50PPM
tolerance @ 25 degees C.

Is this what I should order? Jan's ordering instructions say that I
should specify: 1)series/parallel resonance
2)Oven or non-oven
3)frequency
4)Holder type
5)Tolerance in PPM
6)Crystal load capacity

What would a full description be for basic, old-fashioned, fundamental
frequency amateur crystals for what I have described? I would also like
to try building a power oscillator one-tuber of 15 watts input and
would want the crystals to function in this as well.

This was a simple process, I guess, in simpler times. It seems to be
confusing with only basic knowledge today.

Thankyou in advance for any advice or insight on this.

Shane

2416. Antenna for sat. sub audio

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-13 00:00:00 UTC
From: ederdial <esteel@mds.com>
Message-ID: <4ko6v1$chi@mds1.mastnet.net>
Source record: 106044

I am intrested to know if an antenna can be constructed (other than a dish) to receive the sub audio signals with a TVRO receiver.
Any help on this would be apreciated.
THANKS EDERDIAL

Please be more specific: the cheapest SAW filters cost close to nothing and are used
in TV set. However, they are for HAMS close to not valuable as well.
They are not tunable, because they work as follows (don't catch me on
details, I'm not a pro):
a sound wave is made in a piezo crystal be putting voltages on a set
of stripes on the piezo crystal (btw: all crystals are piezo's!).
Just like in an antenna for VHF resonators (thus: metallic stripes)
are put on the crystal to 'filter'. Later-on such a set of stripes is
used for receiving the mechanical wave and converting it to electrical
signals again.
This also points to a weakness of these filters: the losses are in most
cases rather large.
I hope I'm understandable and correct.

Bye,

PE1BIZ

>I am in the process of switching internet connections, so for a few days I
>receive this newsgroup on both AOL and Netscape.
>
>The strange thing is, that the messages I receive are different. Some
>arrive only via one connection, some via the other, and some on both, but
>often at very different times, sometimes a day apart.
>
>Can anyone explain this?

Sure. Usenet is a cooperative of servers located throughout the world.
Each exchanges posts with at least one other. Eventually every server
in the system gets all posts (unless there was a communications failure
somewhere in the forwarding net). Because each post may take a different
path through the forwarding net, different servers will receive the post
at different times. Some servers only forward to their partners once a
day, so the delay can be substantial if many servers have to be traversed.

There is no central control or central plan. Usenet is a chaotic system,
and connections are at the whim of individual system administrators. So
there can be routing loops and routing stubs, IE some parts of usenet
may be unreachable from other parts of usenet. So not all posts make it
to all servers. To avoid that, most usenet servers have multiple forwarding
partners scattered widely across the net so that if one route is a stub,
another will not be, and the posts will propagate. This often leads to
many duplicate posts arriving at a given server, but the news server
software detects this and deletes duplicates automatically so that the
user should only see the post once on a given server.

If you read news on more than one server, you'll see the same articles
again, though perhaps not in the same order or at the same times. This
is a natural result of the way the system operates. If you see a post
on one server but never on the other, that may mean there's a routing stub
somewhere in the path of the one who didn't get it. The server administrator
might need to establish another forwarding link with another partner in
a different part of the net to avoid that happening in the future. Or it
could be that the news software gagged while processing one batch of posts
so that group of posts never appeared on the server. It happens from time
to time that a batch is corrupt, or the machine processing it hiccups
at the wrong time. There is no assured delivery mechanism in usenet.

Note: usenet and internet are not synonyms. While today much of usenet
traffic is forwarded over internet links, not all of it is. Some still
travels by uucp links, or moves over other networks by other means.
Usenet is a *virtual* network, riding atop other real hardware networks,

some centrally planned, some ad hoc.

> know of such a modification. All answers are appreciated.

George

You mean recieve only " RIGHT "

Would not want your "FRIEND" to go astray of the law, eh!

Although the licence requirements for the 11 M bands are
very lax, there is one thing that the law requires and that
is the transmissions are below very specific power levels and
on assigned frequencies. Failing to comply may bring a complaint
and then the respective departments in the government react
swiftly , and harshly. It can be very expensive and in some
cases accomodation is provided by the state for various periods.

I believe I have seen your posts on other matters in the past,
that have raised some disscussion. Perhaps take the time and
read the regulations and laws set out by your government and
the international agreements that make the world of radio
communications possible..

If you don't have the technical skills to know how to modify the
radio, I doubt if you would have the skill to ensure that you
could meet and maintain, all the requirements to have the radio
type accepted for use in the 11 M band....

There is nothing wrong in learning how, but I would suggest you
limit the mod to recieve only.

If your are serious about learning how the FT200 works and
require manuals and schematics, I can provide you with a
photo copy.

Right. The old circuits tended to have more crystal current than newer
solid state designs (and more voltage applied to the crystal too). That
leads to more heat, and tiny crystals can fracture, not to mention drift.
Also be cautious of applying DC to the crystal, that can fracture it at
turn on too.

This latter is tricky even with big old FT-243 crystals. You need a tube with a high gm, and *lightly* couple the crystal to it to reduce crystal current to the minimum possible that still results in positive frequency control.

A common problem with the one tube cystal oscillator/transmitter was
trying to get the most power and as a result breaking the crystal.
You also get frequency drift from the cystal heating.

SO go ahead with the one tube transmitter but don't try to get
too much power.

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Have RFI problem from my Icom 735 radio and 20 meter dipole in attic.

My and my neighbors Stereo equipment and her sound system on her computer
are the biggest problems

My stereo has signals that are loud. I tried putting LC filters in the speaker
leads, no dice, disconnected them and still have loud signals. My theory is
it is the line (110v). When I raise the volume, the interference gets a bit lower and
audio comes in over the interference, but the interference does not increase in
volume with the volume control with headphones only hooked up to stereo.
My Computers sound system also has noise.

My antenna is in the attic with many 110 v power wires. I also get interference
to my computer sound system and the stereo itis hooked to.

Could RFI be getting into my line ???? Can I put toroids into all the AC lines ???
What are the typical cures for this ??? Is there a book on RFI, ie., like the
Antenna book or handbook ??? Any other tests to try to diagnose the problem ???

Please help, I am really excited about having the time to get on HF now...

Mike WB2TBQ

Last august, I had the chance to visit one of the big names in crystal/ oscillator production, Piezo Crystal in Carlisle, PA. This was on a business trip and we were given a tour of their production facility.

Piezo produces their own blanks from quartz crystals, and the first step in the grinding process is to lap the crystals to approximate thickness. This is done by monitoring the frequency at which it produces noise on a nearby general coverage receiver. During rough grinding, the output is rough, raspy noise, and they stop with the frequency still lower than the desired. As they go through progressively finer grade abrasives, the sound becomes progressively more clean until at the polishing stage, it sounds more like a CW note. Final frequency setting is done with more exact methods.

But, yes, the grinding of a crystal produces mechanical forces that cause electrical noise and you can hear them on a receiver with a small

antenna. One of the coolest things I've ever had the chance to observe.

73,
Bob

Motorola has a data book which you should get a copy of.
It's the "Sensor Device Data" book, document DL200/D. The
copy I have is Rev. 2, dated Q2/95. There could be a later one.
A local Motorola Semiconductor sales office or dealer should
be able to get this for you. The Richmond, VA, sales office
phone number is 804-285-2100. They should also be able to point
you at suppliers who stock the sensors (but don't be shy about
requesting a free sample, after describing what you plan to use
it for -- worst case, they'll say no).

In addition to the data sheets, the book has application notes
which describe how to interface the sensors to things like a
microprocessor.

Good luck on your project.

No such luck. For C Band, your typical transmit power is 15 watts or so over a 20 MHz bandwidth from 20,000+ miles away. I once computed the voltage at the input to the LNA as something like 7 microvolts, using a 10-12 foot dish. For Ku band, your antenna scales with the signal's wavelength, and the satellites are more powerful, so your dish can be smaller.

You need a lot of gain, and antenna with a narrow enough beamwidth to selectivly pick up a satellite operating on the same frequency as another one only 2 to 3 degrees away.

That means a dish. Or if you're a genius, a phased array that would be even bigger.

See if you can find a copy of "Electronic Prototype Construction" by
Stephen B. Kasten. A 10-15 year old book from Sams, back before
the computers books took over.

Or check out the local silkscreen suppliers. That's a large and
diverse industry with a mind boggling selection of materials.
Try to find a place that supplies the local sign shops and tee
shirt makers. At least around here (Seattle) the local art supply
shops don't have anything above the level of dabblers, while the
local sign supply place has a 3/4 inch thick catalog with all sorts
of epoxy inks and plating resists.

From: flanders@znet.groupz.net
Message-ID: <4krn8k$hps@news1.sunbelt.net>
Source record: 106066

Last September, I bought three unused 12" x 24" PV panels at a hamfest in NC. They were unmounted, just the glass panel with the bare metal coating on the back. I was told they were rated at about 900 mA at about 18 volts each.

I have finally gotten around to actually connecting electrodes and testing them out. The first one only put out about 250 - 275 mA in bright SC sunlight yesterday (charge current into a 12 v lead-acid battery, with an isolating diode in the circuit (same without the diode - I checked).

I thought that perhaps the first one was bad, so last night I wired up

connectors to the remaining two and tested them out today. Same thing - about 250-275 mA each. Right now, all three are going, with a separate isolation diode for each, charging a total of about 800 mA in full sunlight. I briefly shorted the three while connected together, and measured only about 1 amp total (about 27V open circuit).

Keep in mind that I am talking about 6 square feet of collector area, and there is as yet no protective glass or cover of any kind. Quickie rough calculations tell me my efficiency seems to be way down.

Any comments? What charge current do you guys get per square foot with PV cells? They have been unused for a long time - any reason to expect

improvement in the future? Maybe I just got rejects - would rejects be as consistent as this? Do rejects deliver low current, or low voltage, or what?

Hi!

I'm working on an amateur project with DSP, in which a part will be to decode a PL tone from
receiver audio. At this point I am inclined to use a phase-locked loop emulated by software.
Has anyone worked with this type of project before, perhaps something similar used for DTMF? I'd like to hear from you!

In this latter vein, I'd always heard the way to get the fastest notice
from the FCC (put another way, to be the most annoying) was to put out a
signal on the aviation distress channels.

That way you have _two_ government agencies, neither one known for their
excellent sense of humor, trying to find you and make you stop. Might be
just the thing if you were shipwrecked.

"glass panel" implies to me ("cells" are build by thin layers on
the back side of the glass) that you have amorphous silicon cells
which are about 1/2 as efficient as crystalline cells.

I was playing with one 12" x 12" today, about 17 V open circuit
and about 200 mA short circuit (was also doing about 13+V into a
165 ohm resistor).

>I have finally gotten around to actually connecting electrodes and

Really 27V open circut? Wow, how many cells are in series for that?
Perhaps they aren't designed for 12 Volt output, rather 24 V?

So if you used a switching (stepdown) regulator, 24 to 27 volts
in and 13 volts out (at about double the current) you'd have
twice the power going in to your batteries (rather than just
wasting it the extra voltage...)

>Keep in mind that I am talking about 6 square feet of collector area,

sunlight is about 1000W/sq yard -> 1000W/9 sq ft 111W/sq ft. A
book says these are about 6% efficient so perhaps you should get
12W / panel. At 24 volts that would be 500 mA each. Your panels
sound close to this (all very very approx...).

Hi Mike. There is WWW page on interference problems from the FCC: Goto URL

http://www.fcc.gov/Bureaus/compliance/www/tvibook.html

Or using a search engine -- search for FCC page.

My 1996 ARRL Handbook for Radio Amateurs has lots of info.
Drop bye ur local Ham Radio Store -- have seen several books devoted to
the subject.

Pick up QST and look at the publication page for an Interference Handbook.

Hope this helps

CB linears are certainly illegal to use in the USA and Canada, so it's
unlikely anyone here is going to tell you how to break the law.

On the other hand, amateur radio operators may build all sorts of
amplifying equipment and use it quite legally in the amateur bands.
May I encourage you to visit a local ham club and see how easy it would
be to get a license to do this sort of thing first?

>Mike WB2TBQ

Mike,
It's gonna be tough with an attic antenna. Put toroids on
everything - speaker leads and a.c. lines. Sometimes a small disc
ceramic (about 0.01 or so) across the speaker leads on the stereo will
help. Don't use anything bigger, it will affect the audio and maybe
the impedance the amp sees. Same thing for the computer speakers.

You might try qrp, I've been working the contest this evening and
am working all over the country on 5w! Not bothering my wife's tv
either!

Source record: 105983

hello peter,

i saw your request for 2m amps using 4cx250/2c39, here some facts:

Do not overstress price and construction needs of transistor and tubes. The things depend on the power level you start with and you want to reach.

for 1-25w input i would say a power module as they are produced by mitsubishi and others is the easiest way to reach 100w (and if you couple two of them even 200w). also the price is not too much.

this is because you did not consider the power supply needed...

First, for the 2c39 you will need a 1000V-1200V supply. biasing is easy as it can be done by a simple zener diode, or better with an adjustable one. maximum output power with a single tube is about 100W-150W.

Second, for the 4cx250 it gets more complicated. first you will need 2000V-2500V anode supply, stabilized 350V for the screen grid and -100V (switchable to adjustable -55V) for the control grid. So this is a complicated triple power supply.

Third, you must think about the cabinet and mechanics. Transistors are mostly easy as they can be assembled to a PCB and are ready to go after that. Tubes always need metal cabinets which are not easy to make without tools.

I am very shure about what I tell you. I use a homemade 2*4CX250 on 70cm, a 2*2*2C39 on 23cm and currently I build a GS35B amplifier for 2m.

>I'm considering the construction of a new linear amp using
>the Svetlana 4CX1600B. This is the Russian version of the
>original American tube.

The 4CX1600 is a unique tube made in Russia. It isn't the Russian version of anything ever made anywhere else in the world, especially an "origninal" American tube.

> This tube is very attractive because
>of the low drive requirements, grid driven with a passive
>input circuit.

Don't count on it being easier to use or cheaper and easier to build. The simplest and cheapest amps to build are grounded grid triodes. It will remain that way until someone invents a linear amplifiying device with two terminals instead of three.

I know what you say is what recent articles about that tube say, but remember that information comes from marketing people that **want to sell tubes**.

The truth is this. Grid driven amplifiers faded from the amateur market because they are much more costly and difficult to build. Grid driven amplifiers are more difficult to tune, and generally less compatable with the drive power of amateur exciters. They require expensive regulated and protected screen supplies, and constant attention to screen current and output tuning. None of that has changed, despite what marketing people would have us believe. Right now I'm corresponding with two amateurs who have built 4CX1600 amps, and are having a real time getting them going.

The recent QST piece about the 811A that shamelessly plugged the "4CX1600" should have been a paid advertisement, not a QST article.

> The question is, does anyone have experience
>with the Svetlana transmitting tubes, and more specifically
>with this one. I'm using their 6550C's in an audio amp,
>and they are great. Leave email if you have information.

I understand Svetlana tubes are OK, my only concern is they are being touted as an "easy and inexpensive improvement over grounded grid". In today's world I guess that isn't so bad. In advertising, one out of three is pretty good. They certainly are inexpensive.

2455. Press-n-Peel and Scratched Copper

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-15 00:00:00 UTC
From: af389@lafn.ORG
Message-ID: <199604151306.GAA12557@zook.lafn.org>
Source record: 105985

Hi,

I am making my first PC Boards using the dry Blue Press-N-Peel film with a common home clothes iron and a Laser Printer. Except for very deep scratches in the surviving copper surface of the etched finished PC Boards, the first three boards looked pretty good and functioned as excepted. First two board required no touch up due to lost toner. Board number three, some toner stuck to PnP film and the board needed toner patch-up before etching.

Just before heating the Press-n-Peel film , I preheat the bare clean unetched copper board by laying the hot iron bottom directly onto thecopper surface. Immediately, scratches appear. The clothes iron surface seems to scratch the new copper. These are fine scratches and not deep. But, after placing the Press-N-Peels film on the hot board, and ironing, the deep circular scores and scratches appear on the unetched copper and can be seen in the toner patterns.

Is anyone else seeing these deep scratches?
How do I avoid these scratches?

Press-N-Peel instructions tell us to use a circular motion when we are heating the film with the iron. After etching, the scratches on the surviving copper show the same circular pattern as I used during heating. The toner still covers the scratches, thus no copper is etched away at the scratches. Looks bad, functions OK.

The clothes iron I used for boards 1 and 2 has a non-stick coating. The botton surface appears free of burrs. But the Press-N-Peel film and the copper show numerous scratches.

I purchased a new clothes iron, this one has an aluminum bottom heating surface, that looks feels smooth. Same problem, just plenty of scratches on the film and on the finished copper surface of the etched board.

I certainly need help with this problem.

What kind of surface is needed on the clothes iron bottom surface to avoid scratching the copper. Press-N-Peel advertises that this can be done with a common house clothes iron. I am sure they expect the final etched PC Board to be scratch and score free. Is there an email address for the Press-N-Peel folks?

Any advise is appreciated.

73 and thanks, Dave W6MIK, af389@lafn.org

From: Norm Hammar <norm@cqg.com>
Message-ID: <31724651.5DFF@cqg.com>
Source record: 105986

Has anyone recently built an HF transmitter (50-100 watts) that you would be willing to share the instructions? Looking for a project for my son and me to build...and this is what he selected. We would need insructions, parts list and suppliers, and schematics. Thanks
norm@cqg.com

Frank,

I worked at a company where the ME would plot a mirror copy of the
screen on clear mylar overlay. The overlay was then placed on the
front panel of the equipment (ink/toner side toward panel). On most
panels it looked good. With the ploter they could do multiple colors
as well.

Have fun,

Mark Trevisiol

>Please help, I am really excited about having the time to get on HF now...

Mike, you've probably pinpointed the problem, coupling between the antenna and the AC wiring in the attic. You need a choke in the AC cords to limit RF access into the affected equipment. You can use toroids or ferrite bars. Just wind several turns of the power cord around or through your ferrites. In some cases bypass capacitors can help too, disc ceramics of about 0.001 uf with a 600 working volt rating will do. (There is potential danger here, and UL may not approve, so use capacitors with caution on AC wiring.) Note, you can also use the cores of flyback transformers salvaged from junk TVs as your forms if you don't have any ferrite bars or toroids.

Now such filters can help, sometimes enough to make the symptoms go away, but a better course is to eliminate the problem at its source, IE get the antenna away from the power wiring. It often doesn't take a lot of distance to make a large improvement. If it isn't already, mount the antenna at the very peak of the attic, as far from the AC wiring as possible. If you can, orient the antenna so that it runs perpendicular to AC wires instead of parallel to them (this can be hard to arrange). Best, of course, is to get the antenna outside and as high as possible.

The FCC prints a pamphlet on RFI causes and cures, but it isn't very technical, oriented more toward the consumer. A better book on RFI causes and cures is offered by the ARRL.

Dave,
Have you considered your oven? We used a plain old oven set at 400F (200C) for years. It is more even than a clothes iron and will not scratch the board. Put the board in for about 7 minutes, or until it just starts turning purple (the oxidation will not affect the toner adhesion), then remove it and place the pattern on the board and use a rolling pin to roll it down. Works great.
For cleaning the board, we use a Scotch Brite green pad and Comet cleanser, followed by a water rinse, then an acetone rinse. Can't say we've ever seen the scratch marks you refer to.
Good luck.

>as consistent as this? Do rejects deliver low current, or low voltage,
>or what?

Jerry, the current rating for solar panels is the *short circuit*
current. And the voltage rating is the *open circuit* rating, both
in full sun on a clear day with the panel oriented dead on perpendicular
to the sun's rays, and the panel held to a temperature of no more than
25C. You won't ever get all of that at the same time, so the charge current
into a battery will always be less than the panel's current rating.

The curve relating panel voltage and current is non-linear, and
there is one point where you get maximum panel *power* output,
but it's rarely the point where you hook the panel to a battery
through a isolation diode. For high efficiency charging, you
need a DC-DC converter that keeps the load on the panel at the
high efficiency point and steps up the voltage to charge the

battery at the required rate.

Your panels are obviously of an older design, and don't have the efficiency of some of the newer panels, but the way you are operating them may be hurting you more. The efficiency of solar panels declines with temperature, so you need to arrange to keep them as cool as possible for best output too. And of course they need to be placed dead on perpendicular to the sun's rays, a tracking mount is required for best efficiency. And a proper charge controller is needed to load the panels properly and deliver the most effective charging voltage to the batteries. If you don't watch out, however, those "improvements" can wind up costing you more power than you gain.

The attitude of many solar power advocates is that since the "fuel" is free, they don't care about efficiency. But as you've discovered, it's the cost of the physical plant that limits how economically you can obtain solar power.

Solar panels don't improve with age, in fact they degrade, so they won't get any better, but you may be able to improve how you are using them in order to get the most out of them. Your panels, properly oriented in bright sun, should be intercepting about 300 watts of solar energy. If they are older panels, the efficiency will be less than 10%, so you shouldn't expect more than about 30 watts out of them if you load them properly, less if you don't. The *best* panels get up to 30% efficiency, so that would give you around 90 watts, but you don't even want to know what panels like that cost.

>
>Is anyone else seeing these deep scratches?
>How do I avoid these scratches?

Didn't your mother teach you how to iron "delicate" things?

Don't ever ever touch the hot iron directly to the copper or to
the transfer sheet. *Always* use a cover cloth. Old cotton Tee
shirt material works fine, or well worn flannel shirt material
will work too. Use *lots* of pressure, but don't get too vigorous
with iron motion. Just move it enough to get even heat transfer
across the pattern. It you scorch the cotton, you left the iron
down too long.

I usually preheat my boards under a heat lamp. Remember the
board has to be perfectly clean and oxide free. Don't overheat
it or leave it heating too long or fresh oxide will form and
mess up your transfer. The copper always has tiny scratches
in it, it is the overheating that is highlighting them due to
oxide formation.

>Highly recommended.

I agree, though I'll mention in passing that Bill's designs tend
toward rather wide-spaced (ie, long boom) variants of the quad.
There's nothing intrinsically wrong with that, and they will work
well, but mechanically they're a bit of a bother. Most recent designs
that I've seen are much more close spaced.

2466. Cable TV tuner for UHF receiver

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-15 00:00:00 UTC
From: forrerj@ucs.orst.edu
Message-ID: <4ktsmv$402@news.orst.edu>
Source record: 105996

Hi,

I have a couple of Mitsumi Cable TV tuners and was wondering whether they were worth using as the basis for a UHF receiver.

These have several bands that is selectable by applying 5V logic to a selected pin - the range that I'm interested in, tunes from 190 - 450 MHz - the VCO tuning for this range corresponds to 0 - 20V. Output IF frequency is 45 MHz.

In general, if I'm interested only in the 70 CM ham band, would these units be worth considering as as starting point?

Comments or suggestions would be appreciated.

Thanks,

--Johan Forrer, KC7WW

2467. ***** Please help FT-10 Mods needed..*****

Newsgroup: rec.radio.amateur.homebrew

Can anyone help,
I have a Yaesu FT10R (b1) and wonder if anyone has any
mods for the radio?.

If you all ready have a FT10 with extended RX could you please

1. Remove the battery pack.
2. Remove the "Ni-cad" sticker (The sticker will peel off with any
damage to itself.)
3. Remove the two screws which secure the keypad.
4. The keypad will now be released from the radio.
5. You will now be able to see the green PCB and Solder pads (H,I,J)
and SMT Chips/Mounts (k,L,M,U,V).
6. Grab a pen and paper and take a note of the position of all the
pads ETC.

Eg. l,M,V are Chiped and Pads H,I are soldered.

7. Reassemble the radio.
8. Please E-mail me DIRECT with your findings..
9. Give yourself a big pat on the back..!! and have a cup of coffee.

Please Remember to E-Mail me DIRECT...

Thanks Ray..

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October 1994 to add the discussion of non-Usenet mailing lists and streamline most of the history discussion, and to change the moderator information for rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Yes, I'm aware of the delay lines used in TV's for luminance comb filters, but the SAW devices I'm looking for are something else. Apparently, they are used in things like garage door openers operating at around 300MHz, and replace the tuned L/C circuit in a simple colpits oscillator. Better freq stability than discrete oscillators, and easier to use than crystals with freq doublers, triplers, etc. The whole TTL to RF low-power transmitter circuit consists of about about 10 components. There is some information on the Siemens www page, but I'm trying to find out who the other vendors are, what frequencies are available, and if the operating frequency can be "pulled", or frequency modulated with a varactor.

Source record: 106002

This system was developed in 1950 by Bob Carter and was called Carter
modulation. He developed it for mobile use in the days of 6V. car
batteries and dynamotors inorder to reduce power consumption. A switch
controlled the screen grid clamping voltage allowing either controlled
carrier or normal screen grid modulation. I used the system with an
ARC5 transmitter in the early 50's and it worked great with just a
little non-linearity in the modulation.

2473. radio homing devices..help!

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-15 00:00:00 UTC
From: skacore@wpi.edu
Message-ID: <4kuff9$h4f@bigboote.WPI.EDU>
Source record: 106003

I'm planning the design of homing device, or "bug" to track the movement of a transmitter across about a square mile area. I'm planning on using some kind of triangulation system, and once the relative signal strength is known from each tracking antenna, these radial distance values need to be fed into a computer through an a/d converter. The transmitter also has to have some kind of long-lasting, or regenerating power supply. The problem is, I don't know where to start, and I've only had a little experience in electronic theory (enough to understand what's going on and to build the device).

What I'm looking for are webpages, books, and personal advice on the design of this device. Any help would be GREATLY appreciated.

Most likely you have amorphous panels. They can be identified by their uniform brown color. These perform very poorly in less than absoulte full sun, which doesn't happen often. I've always been disappointed by them, except maybe in a solar calculator or other application that requires only a miniscule fraction of the rated output. Trade them for crystalline (appear blue) panels instead. The cost is about twice as much per claimed watt, but you can expect to get close to the rating, if exposed to a reasonable level of sun, and even some useful power in cloudy conditions. Also the crystalline panels develop more than twice the watts per area. I wouldn't install amorphous panels even if they were given to me (well, maybe if I were in a low-latitude desert and could count on full 1 KW / m^2 sun all day), so if that is what you have you may have some trouble liquidating them.

>Jerry, the current rating for solar panels is the *short circuit*

>to the sun's rays, and the panel held to a temperature of no more than
>25C. You won't ever get all of that at the same time, so the charge current
>into a battery will always be less than the panel's current rating.

Solar panels act pretty much as constant-current sources from shorted up to near the rated voltage. The current decreases by maybe 5% over most of the range. Slightly before the rated voltage is reached, the current output starts to decrease sharply. The rated voltage and current are the optimum operating point to draw as much *power* from the panel under full-sun conditions. This point is slightly down on the "knee" of the current vs. voltage curve. If you just heard

the rating by word-of mouth it may not conform to this convention of course, but usually the rating is xxx mA @ xx V with the understanding that this is the peak power point under nominal "full sun".

A full-blown "charge controller" automatically finds the optimum peak power point, which is neither the maximum voltage or the maximum current. For a small installation, it is more economic to just obtain a panel with a rating of 15 to 18 volts (for 6-cell lead acid battery), go on the current rating (thus slightly oversizing the wattage rating) and dump the panel output current straight into the battery. If you are considering more than 50 W or so of capacity, then charge controllers, tracking mounts, etc. should be considered in their cost trade-off against buying more or larger panels.

With a direct (through diode) connection to the batteries, no regulator at all is required unless the battery can't tolerate overcharging, in which case a shunt regulator is probably best since it doesn't reduce performance at less than full charge. Yuasa sealed lead acid batteries are designed to overcharge for moderate times (a few hundred hours) at up to 10% of capacity but other brands or wet cells may not fare as well.

From what I've read, the single most important factor in maximizing the output of your solar supply, whatever its fabrication technology, is *tracking*. If I remember the figure correctly, a panel that is set up to track the sun over the course of the day is supposed to produce 40% more electricity than an equivalent south-facing fixed panel.

: Has anyone worked with this type of project before, perhaps something similar used for
: DTMF? I'd like to hear from you!

Analog Devices publish a set of books on DSP applications. My set is at home at the moment, but I think it's in "Digital Signal Processing Applications Using the ADSP-2100 Family" that they give example programs and a discussion of tone decoders. They implement a multi-channel DTMF decoder, just to illustrate that there's _plenty_ of processing time to do this sort of task. The filter they describe is more closely related to an FFT than to a PLL. I believe it uses the Goertzel algorithm, which you can find in other books on sampled-time processing.

>its output as appears at its input. If the noise limited SNR at the input is
>-20 dB, it's still -20 dB at the output. Can you use an SNR of -20dB? If so,

True enough, and if the SNR at the input is -100 dB then it's -100 dB at the output so the sensitivity of the ideal amp is dependant only on the input SNR and given an ideal source with no noise, then the sensitivity should be infinite. OK, there is no such animal as a perfect source so the whole thing's a bit academic anyway.

hello peter,

german or english, what do you like more? See my comments below... lets keep it in this way of posting.

at least, what is your callsign? are you already qrv on 2m or 70cm? We could arrange a sked as during contests its always possible to work PA stations using 10W and standard yagi from my station.

| > is DL4MEA
| is Peter from Netherlands

|
| > Do not overstress price and construction needs of transistor and tubes. The
| > things depend on the power level you start with and you want to reach.
| >
| > for 1-25w input i would say a power module as they are produced by
| > mitsubishi and others is the easiest way to reach 100w (and if you couple
| > two of them even 200w). also the price is not too much.
|
| True, this may be the easiest way, but I have a sort of 'love' for
| red-glowing tubes ;-) For you the price may not be too high, but I like
| to build it myself instead of buying of-the-shelf. For me, most fun is
| the building, not the transmitting :-(

Ok, I agree and accept that reason. Otherwise it would not be worth the work. But for the VHF tubes you will not see red glowing, despite the old fashioned QQE06/40, but if you really intend to use this tube it would be better to use a dummy load hi...

| >
| > this is because you did not consider the power supply needed...
| Indeed, one big problem. I had a magnetron trafo (about 2000V secondary),
| but this one is no more. Apparently some shorting, it drew 2.7A, without
| any loading attached.... So that's why they gave it to me.

Transformers are sometimes available on fleamarkets or (commercial) surplus sales. Sometimes really cheap (around DM 50-100) as most of the companies do not know what to do with them.

| >
| > First, for the 2c39 you will need a 1000V-1200V supply. biasing is easy as

| > (switchable to adjustable -55V) for the control grid. So this is a
| > complicated triple power supply.
|
| That's the main reason I want to use the 2c39 first and not the 4cx250,
| even though it can deliver more power. I've had some remarks of the sort
| 'they use 2c39's for 23cm, why use them on 2m?', but the main reason is
| the simplicity (relatively speaking) of a grounded-grid 2c39.

Lets think about the usage of 230V:230V transformers. take four of them with secondary in series and you will get 1300V after the capacitors. This will drop during transmission and give a suitable anode voltage. They could be cheap as you need only a quarter of the power. I would say take 100VA transformers and you will have enough power to feed a double or triple tube amp. Spent some more power to the power supply than needed, as this would give you the possibility of reusage. (I have an supply working with 3phase power providing 4kVA continous power which is used with just about 2kVA at the moment, but will fit with any others later). Another possibility is to take two transformers and build a doubler reticifier (spannungsverdoppler-gleichrichter), whatever will come cheaper.

Also, there are some german suppliers which already have ready wound transformers, and they are not too expensive (about DEM 100,- to DEM 300,-).

| >
| > Third, you must think about the cabinet and mechanics. Transistors are
| > mostly easy as they can be assembled to a PCB and are ready to go after
| > that. Tubes always need metal cabinets which are not easy to make
without
| > tools.
| Already got all of those, tools no problem either. I've already made a
| mounting for the 2c39 (fortunately, my father has a lathe, so that makes
| things much more simple ;-)) Bought a nice cabinet too, from an old
| IBM-power supply: nice, strong & big.
|
| > I am very shure about what I tell you. I use a homemade 2*4CX250 on
70cm, a
| > 2*2*2C39 on 23cm and currently I build a GS35B amplifier for 2m.
|
| Still, my question remains: how do I calculate/find the coil-values for
| the 2m-version using a 2c39? That is, can you use wire-wound coils with
| valves, or should I turn to Lecher-lines, coaxial-circuits, etc? These
| last seem fine for 70cm, but coils would certainly be easier (at least
| for me). I guess the in/out capacities of the 2c39 won't be a problem for
| using coils, or are they?

Hm, yes and no to these statements. For a 144MHz amp to reach suitable power you need a cavety design, at least I know one design made by DJ9HO which uses a standard coil made from about 5 windings dia 60mm and 60mm long. If you are interested I could check for it. But I strongly do not recommend it!!! Even if I have about 15cm of paperworks of tube power amps I don't own this because i did not find it interesting because of the small power.

Stripline designs are mostly better and also easy to build. But although you have a cabinet I do not think that you can use it directly, since the dimensions of the cabinet depend on the stripline (most of the striplines have an impedance of 50-80ohms, so stripline width and cavety dimensions depend on each other. the values cannot vary much because of the tube dimensions (distance between ground and stripline is close to the distance between grid and anode ring of the tube...)

Tube mountings, so called sockets, are sometimes used as they can be bought from the suppliers, but most of the time they are inclued into the cavety design using finger stock material (costs about DEM 50,- per meter). Milled mountings were also seen, but need low mechanical variations.

On 2m most of the time shortened quarter wavelength striplines are used. there are some designs that use flat striplines, some use copper tubes. copper tubes may be a little better, but are only useable for tubes like the 4cx250 where it is possible to blow the cooling air through the tube and then through the copper tube. this is not possible for the 2c39 where you have to blow against the tube.

So, at the end, if you are still intersted, I could check for the design from DJ9HO, but I would not recommend it. Stripline designs are rare but maybe available from DJ9HO, too. There is a fleamarket in Nuernberg at April, 28th, where I could check for the books and buy one for you if it is really interesting.

Hey, at least, another idea: Since some times a lot of interesting russian tubes are on the market, also cheap, but they deliver about twice to four times the power of the 2c39. DJ9HO is a good source for instructions how to use them, and if ever possible there will be a chance to find these descriptions in the books mentioned above.

cul!

Re: New Svetlana Trasmitting tubes

Any of the 4CX1000A designs should work well with the Svetlana 4CX1600B..
There have been several designs in the ham magazines.
I use one 4CX1000A in a 1.8 to 54 mc amp and one on 144 mc. These
tetrodes are all similar, and the circuit need not vary with the tube
mfgr.

Hello, I have obtained an Eico model 710 Grid Dip Meter, covering
0.4 to 250 MHz, but no coils. Internal inspection reveals three
terminals for the coils, and a small test with a coil of wire didn't
come out too nice.
Anybody have any information on how the various coils are wound or
where to get a copy of a manual?
Trying to dip,
galen, KF0YJ

How about this: make your big dipole; wind a nice high ratio transformer
using wood, or whatever (predicated that you have insulated wire, but could
be done without); hopefully find some dissimiliar metal on the boat, using
saltwater, make battery cells with the copper wire and dissimiliar metals from
the boat, run the dc into the stepup transformer, keying the input to create
a spark gap at dipole feedpoint, and send S O S. Even codeless techs can
send S O S. Unfortunately, there are less and less people who can read it!

2489. Re: Solar Cells Efficiency?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-16 00:00:00 UTC
From: Rich Alloway <ralloway@pennet.com>
Message-ID: <Pine.LNX.3.91.960416115141.9394C-100000@mailer.pennet.com>
Source record: 106017

I know I haven't read the whole thread (and that is my fault) but I have read a couple postings and noone has mentioned the actual efficiency of a solar cell.
Just a few months ago, a relatively local company (somewhere in Viginia I believe) was visited by a electrical engineer friend of mine. He has been helping them increase the efficiency of their solar cells. After he "meddled" with their operations a little bit they were amazed at getting 15% efficiency!!! (Yes...fifteen percent!)

Hope this helps a little,
Rich

2490. RF modules for telemetry application

Newsgroup: rec.radio.amateur.homebrew

From: jbarry@intercim.com
Message-ID: <4l0h5d$bq9@stratus.skypoint.net>
Source record: 106018

I am looking for sources for small inexpensive RF modules, seperate tx and rx would be OK, for a telemetry application. Would prefer 470 or 800-900mhz. With the all the consumer rf devices on the market now, 900 mhz telephones and stereo headphones, there must be several suorces for "building block" modules.

Any help on locating information and sources will be appreciated!

2491. ?RF PROBE RECOMMENDATIONS?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-16 00:00:00 UTC
From: tmaldred@mail.comox.island.net
Message-ID: <3173c3a9.261607939@news.comox.island.net>
Source record: 106019

Greetings All:

I am contemplating the purchase of an RF probe for my DMM.
Wavetek manufacture a model RF241 probe with interesting specifications
as follows:

>We have a high frequency probe model number RF241. Specs on this probe are:
>
>Frequency Range: 100kHz - 650MHz
>Accuracy Range: Plus/Minus 1 dB 100KHz-250MHz
> Plus/Minus 3 dB 250MHz-650MHz
>Maximum Input: 50 Volts RMS
>Input Capacitance: 5pF
>Operating Temp: -25 degrees C to +40 degrees C for 100kHz-250MHz
> 0 degrees C to +50 degrees C for 250MHz-650MHz
>Voltage Ratio: 1VRMS=1VDC at the meter.
>
>Extends the range sensitivity of DMMs with 10 or 22 MOhm input impedances.
>No data is currently available on the probe's loading resistance or
>impedance.

I wonder if anyone on this conference that owns an RF241 would
like to provide us with some comments about its performance and design?
I wonder what the circuit loading impedance is and also what limitations
there may be for the minimum voltage that can be measured with
reasonable accuracy? Is there a detector diode non-linear bias knee that
limits the accuracy of the probe for lower voltage levels?

I understand that both Fluke and B&K make similar probes. It
would be interesting to hear comments about alternate choices as well.

My intended application is for generating calibration data for a
digital readout HF peak and average reading power meter. I would use the
probe to measure the voltage across my 50 Ohm dummy load for setting the
various power levels needed for the A-D calibration points. For higher
power levels a resistive voltage divider would be utilized to ensure the
50 Volt maximum specification for the probe would not be exceeded.

There were some solid state (homebrew) designs in the 60's or early
70's that did the same thing. The amount of carrier varied with
modulation and would fall to zero with no audio input.

Straining the brain, I seem to recall that dipper uses the Hartley
circuit. So the third wire connection is to a tap near one end of
the coil for feedback excitation. Memory could be faulty, but I
also recall that the highest frequency "coil" is just a loop of
heavy wire formed from a piece of wire about 6 inches long and
plugged into only the two outside pins of the socket. Feedback
in that case must be by circuit strays. I had one of these many
years ago, but sold it and bought a solid state version, a Heath,
a long time ago.

Tom wrote:

From: w8jitom@aol.com (W8JI Tom)
Subject: New Svetlana Trasmitting tubes

<snip>
The recent QST piece about the 811A that shamelessly plugged the
"4CX1600"
should have been a paid advertisement, not a QST article.
<snip>

Tom:
Maybe I need new glasses but I saw about 15 3-???, 3CX????,
88??, and others made by Eimac mentioned as well as the 811 and 812
made by RCA and others. There is a reproduction of a full page RCA ad
from years ago in the article. There were also mentions of Collins,
Heath, Hallicrafters, Henry, and Drake. Oddly enough I see Svetalana
mentioned *once* generically and Russia mentioned *once* generically.

There was not ONE SINGLE mention of a specific tetrode ANYWHERE in the
article.

Maybe you read a different article?

The only direct reference to Svetlana as a tube manufacturer was the
first footnote that said you could get data sheets for most of the
tubes mentioned from Svetlana, *even if you happen to be using Eimac
tubes* (emphasis mine).

If anything the article was an Eimac ad!

All in all I thought it was a very well written *historical* piece.

I am not sure why the mood has changed but I see a lot of bashing of
QST and QEX here that disturbs me. Come on folks, the staff in
Newington are folks a whole lot like you and me. They are doing the
best they can to produce a quality product just like I am sure you do
for your employer (but then maybe not ;<). They sometimes make errors
in judgement or fall short of the mark. I'm sure glad you and I never
do ;<).

At the very least if we have a gripe let's get the facts straight!
Especially if we air the gripes in public.

Source record: 106024

I know that you wrote 1000ppm, but if you can get away with it,
use a crystal at a subharmonic frequency. Some people double, triple or quadruple the
crystal frequency and thus the warping range is similarly increased. The ppm doesn't
change but the frequency range is increased. I don't remember much about
the matrix equations for describing the characteristics of a crystal but I seem
to remember that larger the physical crystal, the larger the warping range ?
So try to find some big crystals ?

+/- 12% (1 dB) or +41/-29% (3 dB) accuracy seems pretty poor for this
application. And that doesn't include loading effects and inaccuracy of the
meter.

>made by RCA and others. SNIP
>There was not ONE SINGLE mention of a specific tetrode ANYWHERE in the
>article.

The lead, AND LARGEST, picture was a Svetlana 811A. What's wrong with a competitor's tube being pictured, or better yet an *original* RCA 811A ?

Look again at the references. They steer the reader directly to the author's own business. Only reference 2 does not. The articles referenced were all written (with the help of the author) to endorse or support the author's products. The "technical articles" referenced don't describe general tetrode operation, they specifically describe the advantages and use of the ****author's tubes****.

>The only direct reference to Svetlana as a tube manufacturer was the
>first footnote that said you could get data sheets for most of the
>tubes mentioned from Svetlana, *even if you happen to be using Eimac
>tubes* (emphasis mine). If anything the article was an Eimac ad!

Eimac ad? Where is Eimac's phone number, a picture of Eimac's product? Where is Eimac's address or a reference to any construction articles using Eimac's tubes? Funny, in your "Eimac ad" *every single one of those topics* are covered for the author's company, and ONLY that company.

Let's talk about getting "facts straight". I JUST CALLED Svetlana and talked to Pat. She said they don't HAVE Eimac data sheets, since Eimac is a competitor. But she would gladly help me find the closest Svetlana tube to the Eimac tube I was interested in. Some Eimac ad!

Read the "Next Revolution" section carefully. It:
1.) Downplays the cost and complexity of tetrodes, falsely claiming they are more simple to build and operate and some sort of "revolution".

2.) It falsely claims "The zero-bias revolution was ***NOT*** driven by technical performance".

Well, it most certainly was! Zero bias grounded grid amplifiers are easier to operate, more stable, have better IMD performance without regulated supplies, use less components, and are more compatable with the power levels of modern exciters. That sure sounds like good technical performance to me!

3.) The article paints the "tetrode from Russia" as "simple, inexpensive, modern, and high performance". Those are the exact words used.

>All in all I thought it was a very well written *historical* piece.

So did I, except the last section. I see little reason to extoll the virtues of tetrodes manufactured by the author's company in a historical article about the 811A, or tubes in general. I see no reason for only listing references leading back to the author's wallet.

>At the very least if we have a gripe let's get the facts straight!
>Especially if we air the gripes in public.

I hope I have MY facts straight enough now.

For the interested party in E.L.F.:

An ELF recieving system, like what Congress is using on C-Span (I guess?)
can be had from Panaxis Productions assembled for 79.00 . Its the L500

There is also an Ethereal Plane Monitor that can be had for 32.00 dollars
assembled. It is the EPM. It recieve that annoying VLF that are
"voices" that the police department seem to be broadcasting. (That also could
be repeating your thoughts) They refer to it in the catalog as "whistlers"
and the "dawn chorus". For me, they use the voice of a little girl that the
locals named, "the girl with the desperate voice."

For better Quality VLF sound listening and possible recording, you can get]
the L700 for 109.00 bucks.

They seem to be legal and are sold in Paradise, CA. (916) 534-0417

There is also a micro-harminizer that costs 119.00 bucks that broadcasts
hormonics of 7.83 Hz that will block your thoughts from being stolen.
1-800-456-9887.

If anyone else has any devices that are in this field, please let me know.
There are people being terrorized right now and are in hospitals because of it.

>on RFI causes and cures is offered by the ARRL.

The FCC's book is useful in one important regard -- it will help your neighbor understand the difference between transmitter-caused interference and consumer-equipment caused interference. The ARRL also has an "RFI Pamphlet," available from the Technical Department Secretary for an SASE that says the same things (surprise!), but having it said in the FCC's own words often carries more weight with your neighbor. The book is called "Interference to Home Electronic Entertainment Equipment Handbook (CIB-2)." It is available for $2.50 from: (I ordered it by name with no difficulty.)

US Government Printing Office
Washington, DC 20402-9371
Phone: 202-783-3238
202-512-1800 (credit card orders only)
Web Site: http://www.gpo.gov

ARRL also has several interference packages that will offer some fast starter help. Most are available electronically from the ARRL area at oak.oakland.edu or from info@arrl.org. Paper copies are available from our Technical Department Secretary for $2.00 for ARRL Members, $4.00 for non members.

We have the "RFI Pacakge," RFI-Telephone, RFI-TV, RFI-Audio, RFI-Electrical and RFI-CATV. The CATV package is available ONLY in paper form; it is a reprint of an article I wrote for Communications Technology, the journal of the Society of Cable Television Engineers. (I chose that instead of QST because I wanted something hams could hand to their cable operator. They trust CT more than they trust QST, for some reason. :-)).

Our RFI book, Radio Frequency Interference is available from most ham dealers, our Pub Sales Department, using the handy-dandy order form in QST. If you are an ARRL Member, you can get a bit of technical advice before you buy the book by calling us at (860) 594-0214.

>What I'm looking for are webpages, books, and personal advice on the
>design of this device. Any help would be GREATLY appreciated.

Do you want the bad news first, or the really bad news first? :-)

The relative signal strength won't be of much use in determining
the radial distance to the device over this distance span. And
unless the terrain is really flat, multipath is going to complicate
triangulation bearings enormously. If the transmitter you want to
track were really a *transponder*, this would be a relatively
simple job, but if it is just a transmitter, you've got your
work cut out for you.

It sounds like you want a tiny low power "fox", and that's no
problem, there are plenty of designs that will work, and a
solar cell or two can keep it running indefinitely with the
aid of a couple of Nicad cells (button type). I've seen them
built into the collar of a cat.

The DFing gear will be more complex. Probably your best bet
is to use a doppler direction finder at each DF site, and
telemeter the bearing information back to a central computer
site. You'll have to do some wizardry with the software to
eliminate bogus multipath information. You could use mechanically
scanned beam antennas instead of doppler units, but that's bulky,
finicky, and ugly.

Unless your target is in pretty constant motion, eliminating
the misleading multipath information is going to be a hard
job. An alternative is to have one or more of the direction
finding systems in motion, but I doubt you want to lay rails
around your search grid. (Of course if the search area is
variable, you can have your DF units in cars. That works
well.)

TAB books publishes a radio direction finding book for hams,
we call it "foxhunting" and treat it as a sport. The book has
enough information in it to get you started. It's available
from many amateur radio dealers, such as one of the Ham Radio
Outlet stores.

If we knew more about what you're trying to do, we might be able
to give you more specific advice. For example, there are ways
of taking advantage of VLF standing wave patterns to give very
precise location information, but that would require a different
set of design constraints than would a doppler VHF/UHF system.
If we knew how well concealed the transmitter had to be, how
small it had to be, whether the tracking area is fixed or variable,
how precise the location fixes have to be, do we have a predetermined
starting point, etc. we could do a better job of advising you.

>helping them increase the efficiency of their solar cells. After he
>"meddled" with their operations a little bit they were amazed at getting
>15% efficiency!!! (Yes...fifteen percent!)

We have to be careful when talking about solar cell efficiency to make sure we're all talking about the same thing. Violet cells have achieved 36% efficiency in the lab, but that's the efficiency for converting the wavelengths to which they are sensitive to electricity. That's not the efficiency from total solar input to electricity.

On a clear day, the total solar input is 1 kW/m^2 at the surface with the panel perpendicular to the sun. Now the solar flux approximates a black body, and consists of a spectrum of photon energies (and hence frequencies). A solar cell is a quantum device, and can't use photons with less than its bandgap energy. That means that the considerable part of the solar input which consists of IR is useless for our purpose, and only serves to heat the solar panel, which reduces its efficiency. And photons above the bandgap energy throw away their extra energy above that needed to liberate the electron into lattice recoil, IE heat. So only a part of the solar energy contained by shortwave photons is fully utilized.

Further, the panel area is not 100% active. There is the metalization which blocks solar input over part of the cell area, and there is the mechanical mounting of the individual crystaline cells, which always leaves some waste space. So we always wind up with much less than 1 kW/m^2 of electrical output from a solar panel.

In other words, we can't approach 100% efficiency very closely at all. When most cell makers quote efficiency, they disregard the input energy in the solar spectrum which can't bridge the bandgap, and they disregard all area except active cell area. This makes the efficiency number look relatively good, but when you factor in those things, the efficiency number drops rather dramatically. Add in other factors like metalization resistance and recombination losses, and panel efficiency drops to only a few percent at best.

A panel that could deliver 150 watts/m^2 of electrical power (without concentrators) would be a very remarkable achievement. But a panel that can convert 15% of the portion of input energy at or above the bandgap energy striking just its active area is rather mundane.

Greetings Roy:

Thanks for the input!

In my application I am only interested in accurately measuring
the HF spectrum which is only about 12% of the bandwidth of the +/- 1dB
specification which covers 0.1-250 MHz.

On a power scale the +/- 1dB spec would work out to
approximately +/- 25 % of inaccuracy. However, I expect that most of the
error would occur above 30 MHz were the reactance factors become more
difficult to deal with. I think that the probe accuracy may be adequate
within the HF spectrum considering my application. I would sure like to
hear from somebody who has first hand experience with comparing these
probes to a calibration standard.

The loading effect of the probe is an interesting question. The
manufacture specifies the input capacitance of the probe as 5pF
(XC=~1KOhm at 30MHz) which would not impose a load of much significance
across the 25 Ohm (paralleled 50 Ohm source and load) circuit impedance.
Possibly a low Q peaking inductor series circuit could be employed in

the HF spectrum test jig to cancel the loading effect from the shunt capacity at the expense of response above 30MHz.

To date I have not been able to get any information on the magnitude of the resistive portion of the probe input Z. I presume it is probably fairly high as a competitor's product is specified at 30KOhm. I wonder if there is anyone in this group that has had experience with this particular (or similar modern DMM RF probe) that would like to comment?

At a cost of $65 U.S. this probe would seem like a cost effective extension to a DMM for RF measurement assuming it could be used to make reasonably accurate measurements across the HF spectrum bandwidth.

I wonder if possibly these modern RF probes employ new technology which provides better linearity at lower voltages compared to the conventional diode detector RF probes that have been around for decades?

73 and many thanks again for the input!

I bought a similar probe from HP, and it is certainly a useful tool,
but not the same as a good RF voltmeter or RF Power meter. I played
with the HP probe and a calibrated signal generator; and at 20MHz
accuracy falls off fast for signal levels below 100 or 200mV.

I expect that it is similar to the RF probe circuits that I've seen in
the ARRL Handbook.

> Jerry W4UKU flanders@groupz.net

Hello Jerry,

You didn't include enough real information to exactly answer your questions, but I can get you started.

"Reject" solar cells come in many flavors. Bear in mind that calling a low-output cell a 'reject' is like calling a 90ns RAM a reject. Most ram's come out 70ns, but a few come out at 50ns and a few at 100ns. There's always a statistical distribution in the production. Same with solar cells or any other similar device. A 2:1 range in parameters is normal.

In re: efficiency and charge current

Solar cells come in three main types, amorphous, poly-crystalline, and single-crystal. They could also be made of two major material groups, silicon or gallium arsenide. On top of that, they can be single-junction or multi-junction. Normal efficiencies for all these types will vary from 1 to 25% depending on the type.

Amorph Sil - 1-4%
Poly Sil - 3-9%
1-crys Sil - 8-15%
1-cry GaAs - 10-17%

above are typical ranges for production old enough to be surplus.

Finally, incoming energy, or 'insolation', is commonly taken to be 800-1000 watts/sq meter. Sq m = 8.45 sq ft.. At 900w/sqm = 106.5 w/sqft. If array is 12% efficient, that's about 13 watts/sqft, or 912 ma at 14.0 volts (12v batt charge voltage) per sq ft of -active- area.

Most cells produce maximum power when loaded down to a specific voltage (varies with type and mfg.). If you've got normal single crystal silicon, I think it's around .55v, but that's a hazy memory.

You can easily find the best point for your stuff by measuring current while loading to various voltages, and plotting the points as a power (I*E) curve.

Finally, power falls off if the angle to the sun isn't accurate.

Regards,

Richard Hager

Source record: 105944

When I wanted to make a nice front panel for some of my kit, I used a simpler and cheaper method than anodising,silk screens or engraving. A more "amateur" method :-)

Stating with the bare ally panel, I rubbed it down with 1200 (fine) wet and dry, and sprayed it with a cellulose (speeling?) filler/primer as bought in car shops. This gives a good flat white base.

Then application of the nice fonts you can get in Letraset (rub down lettering) these days for the text.

A cellulose clear laquer to protect the lettering , several layers will finish the job.

I've used this on gear I take /P contesting, and doesn't seem to wear off
at all.

A few pounds and few hours and sorted.

Someone, who I've lost track of, wanted info on building a 2m amp using the 4-1000 (I think). I thought I had a reference, but it turns out it used the 5-500 500W pentode. Here's the reference anyway. It may be of use, since 5-500 is a large glass bottle, more similar externally to the 4-1000 than the usual ceramic triodes or tetrodes that make up most of the designs for big amps in amateur publications.

Campbell, R. W., "Kilowatt linear amplifier for 2 metres", 73 Magazine, Dec 1973, pp 29-35.

Perhaps the person who wanted the info would e-mail me so I know he has got the reference. It will save me looking any further for his e-mail address.

For anyone interested, heres a list of references that might be of use to anyone thinking of building a large amp.

I suppose one could make a big loop antenna which is resonant with WWVH or whatever transmits the most power in the area and rectify that for a source of power. The trouble is how would you know if it is tuned correctly?

If you get tired of trying to figure it out, you can go play with Ginger and Mary-Anne for a while....

I have come to the conclusion from reading this group over the past year that you guys do indeed know everything about everything!

I seem to recall that the typical Radio Control receiver is an AM beast which put out some kind of variable width pulse to the servos.

Can anyone provide or point me to specifics: range of pulse width, frequency of pulses etc?

Thanks

Dave

2523. How to interface Osc "cans" w/ CMOS @ 12VDC?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-18 00:00:00 UTC
From: cyamamot@kilroy.jpl.nasa.gov
Message-ID: <4l5l5k$bn5@netline-fddi.jpl.nasa.gov>
Source record: 105951
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics

Greetings,

This may seem like a simple question, and I hope it is. But not having used these components before, I'm not sure.

I have a CMOS circuit running off 12VDC. I need a clock source. Digikey has some Oscillator "cans" (I call them "cans" because they are in those silver cans the size of a 14pin DIP) from ECS that are labelled TTL/CMOS.

What I don't know is, can I interface these ECS TTL/CMOS oscillators directly to my CMOS circuit? I believe these oscillators run off of 5VDC so do I need a pullup to 12VDC on their output? I'm driving a CD4518 chip for divide purposes.

Thanks in advance for any advice.

Regards,
- Cliff

You can't connect direct due to the differing supplies and thus logic
levels. You'll need to use a logic level shifter as an interface.
For example MC14504BD = hex logic level shifter.

If your application is non critical and/or low frequency you could use a
single transistor and a couple of resistors as a level shifter. Crude
but easier to patch into a circuit as an after thought.

Hi Jay,

If you wrote a technical consruction article that had solid theory and offered to help supply parts at a profit I'd have no problem with it, as long as you listed alternate sources (when available).

If you wrote a historical article that steered readers into your personal product with **less** than "factual and unbiased data" I'd have a big problem with it.

Any technically based historical article should present unbiased and correct technical information to the reader, not become a thinly veiled sales pitch at the conclusion. In this case the "pitch" included direct references to products manufactured by the business the author is president of, products that have no relationship to the technical content of the article.

The self serving summary comments could have been omitted with no loss in historic accuracy of the article. The technical accuracy would hve beeen improved. It is especially distressing when the article embellishes facts in order to "paint" the author's products in a more favorable "light" than other competitive products.

By the way, the company is not a US company...if that makes any difference. To me it doesn't, even though the company it hurts is a US

manufacturer. I'm more concerned with technical inaccuracies and the poor editing.

: I bought a similar probe from HP, and it is certainly a useful tool,
: but not the same as a good RF voltmeter or RF Power meter. I played
: with the HP probe and a calibrated signal generator; and at 20MHz
: accuracy falls off fast for signal levels below 100 or 200mV.

There's an article in the Dec. 1995 "HP Journal" about "zero bias detector diodes." There are also some ap notes in the HP "Communications Components" catalog about diode RF detectors. It turns out that if you operate them into an appropriate load impedance (generally up near 1 megohm), the output _voltage_ is very nearly linear with input _power_ (as measured in a 50 ohm load) up to 10's of millivolts, and above the couple hundred millivolt level, they act as peak detectors. When I first started playing with a simple diode detector for close-in fox hunting work, I was amazed to find that I could detect RF down to a couple hundred microvolts. That makes it useful up to a few hundred feet from the hidden fox transmitter in many cases.

Hi Russ,

If you're building a pre-defined circuit that specifies a BFR91, you might want to stick with it. In the freq range that this part is used in, the circuits usually depend on the xsistor specs being a certain value (the cap, induct, gain, etc.).

Just changing from the SOT to the TO92 package will quite possibly change or inactivate the circuit.

Put your list together for the Active order I guess...

Luck,

I do quite a bit of work with data via cell phones (normally mobile -
moving). Data over cell phone is not as simple as data over a normal
phone (if you want it to be reliable). I use a special modem with MNP10
protocol (packets with error checking). I doubt that you will be very
successful with an acoutic coupler - but then I have never actually
tried that.

SNIP...

I have used similar methods, but instead of "decorating" directly on the front panel of the enclosure, I sometimes use plastic laminate - the stuff that covers kitchen counters. It comes in many colors and takes rub-on lettering well. I cut the holes to match the front panel controls, etc. then letter it, and coat it with a CLEAR polyurethane - I use Carver-Tripp's SuperPoly (comes in either gloss or satin). This is a fast drying, water-based polyurethane that is clear (unlike oil based polys that are yellow). I spray it on, but it can be brushed as well. 3 coats completes the job.
Note, I would not use it on the metal, but on the laminate, it sticks just fine provided there is no grease on the laminate to start with (be careful about oils from your hands as well).

Experiment, there are lots of things that work.

All newer rc radios are FM typical pulse width is 1.0 to 2.0 ms. with 1.5 being neutral
The digital PCM encoding scheme also converts to these pulse widths for the servos, so they can be used with both types of
encoding schemes PCM (pulse coded modulation) and PPM (pulse position modulation).

The typical R/C system can be AM or FM.

The neutral position pulse width is approx 1.25 Millisecond wide, while the
range is approx 1 to 1.5 ms at the extremes. The pulse frame repetition rate is
approx 60 frames per second (each frame contains a pulse for each channel
ie. 4 channel r/c system - 4 pulses per frame).

I hope this answers you questions.

BTW You might find one of the rec.models.rc news groups interesting

>Can anyone provide or point me to specifics: range of pulse
>width, frequency of pulses etc?

Dave,

The servos in most hobby RC systems rely on a pulse stream to set their position. The pulse width determines the position, 1.5ms for center, 1.0ms for full left, and 2.0ms for full right. The pulses repeat every 20ms. Each servo channel is transmitted in series in a frame (20ms). The RF output begins a frame by turning off for a fixed modulation time, usually 0.5ms, then goes to full amplitude for the remainder of the channel 1 pulse width (0.5ms to 1.5ms). This is followed by the beginning of channel two, which also starts out with 0.5ms off time.... All of this is followed by a longer sync pulse of RF, and the cycle repeats. The National Semi LM1871 and 1872 used to be popular encoder/tx and rx/decoders used in these systems. They've got a decent description of the methods.

Body handling: Inline uuencoded payload not displayed: STRIP.BAS

You should be able to uudecode this file and then run the result
directly under BASICA on your PC.

Again, the formula for the flat strip is fairly exact, but the formula
for the round strip is an aproximation valid only for D<<H.

Enjoy.

Other Manufacturers include RF Monolithics, in the Dallas, TX area. Texas Instruments still has SAW people, although I doubt if they manufacture any SAWS.
at least for the commercial outside market. Nokia has or had SAW capability, and they did have an interest in ASCOM, of Bevix, Switzerland, a very few years ago.
If you need a good contact point on SAW design, contact Clinton Hartmann of Hartmann Research, Dallas, TX. Please don't waste his time with trivial requests, but remember that he has a business to run! He formerly was an Amateur Radio Operator, and, as you might guess, I have worked for him in the past. Clinton has been designing SAWs since the 70's.

Hi Jay, I'm one of those that has complained in the past about the way some articles in QST have been presented. But I have no problem with the author selling parts or kits (I've done it myself). But I do have a problem with presenting a construction article and then keeping part of the critical information (such as the software or pcb layout) confidential and forcing the reader to buy from the author, or redesign the whole thing. Fine, sell parts and kits, but also provide the information to those that might get more satisfaction out of doing their own work. It probably won't hurt sales that much anyway....

>any chance of elaborating the technique or pointing us to a URL Gary?
>I've been paying screen-printers for years, but if I can do it here
>on the bench I'll have much more neer money left over....

Silk screen printing is pretty simple. You take your silk and spread
it tautly on a wooden frame. Coat it with photoresist and expose your
pattern. When you develop the resist, voids will exist where you want
ink to be deposited. After the silk screen has been prepared, press it
firmly against the panel to be printed, apply the ink gell, and roll
it with plenty of pressure with a hard roller. When you lift the screen,
the desired image will be left on the panel.

Think of the silk as like window screen but with a much finer weave, the
resist fills all the voids except where it has been exposed and developed,
so you're left with a pattern of holes through which you press ink.

Silk screen is like using a stencil, but the fineness of the lines
possible is determined by the fineness of the weave of the material,
and the quality of the resist. Printing silk is available in a number
of weaves. The relatively coarser weaves are easier to use since the
ink flows through the weave easier under pressure, but of course the
image fineness suffers. The finer the weave, the finer the image
resolution, but the more pressure required to force the ink through
the weave. You want to choose the appropriate weave for the job at
hand.

You can reuse a given silk screen stencil many times, and if you clean
it well (with ink solvent) between printing sessions, you can use it for
a long time. Using a different solvent, you can remove the resist, and
then you can lay a new image on the silk and reuse on that level too.

Silk screen printing supplies, IE silk, resist, developer, ink gells,
frames, and rollers, are available from many large graphic arts supply
houses. An easy way to find one is to ask your local Tee shirt printer
where he gets his supplies.

There are machines which accept frames and automatically apply ink and
a uniform and adjustable roller pressure for doing volume printing, but
you don't need that to do one-off printing jobs. A bit of experimentation
with hand roller pressure will enable you to achieve good results. But if

you need multi-color printing, then a machine is a good idea so that the registration for the color separations will be correct. Of course you can build this yourself.

I use a place in Canada called Alberta Printed Circuits. BBS is 403 291-9342.
Download the order frms.
$60 + pcb Area * Exchange rate ($.80)=your cost. Turn around IS FAST!!!
Two sided plated through holes but no silk screen or green solder mask.

I use Circad. I'm jaded as I also peddle it but I really think it far an
away the best software for the money. Hams get a discount so it's worth
checking out the demo. The demo does let you do little designs so try
before you buy. Give me a call if you want it or have any questions.

[rest cut]

Do you know something I don't know? I thought that overtone crystals
only worked on odd harmonics (1,3,5,7,9,11,etc.) and that 5th overtone
was about as high as they go (a few 7th exist, I think). Except when
used with a frequency multiplier circuit. I didn't think that crystals
intended for frequency multiplication were marked with the multiplied
frequency.

If you are comfortable designing phase locked loops, they seem
like a reasonable way to go. You just won't get the stability
required for any sort of narrowband work without making a PLL,
though. (Maybe you could make some sort of AFC scheme work if
you were using it for FM or TV, but that's not possible for SSB
or CW.)

I've thought about doing this myself, but haven't gotten a round
to it. I even have a junked TV receiver someone gave me for this.

So many projects, so little time.

2550. FM Band Code Practice XMITTER- Help!

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-19 00:00:00 UTC
From: eganger@mindspring.com
Message-ID: <eganger.119.0F4E3003@mindspring.com>
Source record: 105977

Hello, I am a Tech-Plus and I am interested in getting a general class
license.
There are others where I work that are working towards their 5WPM.
Also, several Advanced and Extra's willing to help.

What I am looking for is a way to use Part-15 xmitters on the FM band,
with Audio CW so that we can form a "Lunchtime Net"

My first attempt was to AM modulate a 3.58MHz crystal divided by
four, giving about 1 MW on 890KHz AM Band. This worked _really_ well
here at the house with a range of about 200ft to a portable AM receiver.
At work, however, due to building construction and computer noise,
I get a maximum range of about 12-15 feet. (someone said that the
metal floor and the metal ceiling were too close together to allow
propagation at such a low frequency! These same people say that FM
will have no problem filling the area!)

I am trying to design a small transmitter with these important
characteristics:
1. CHEAP -- I would like to see about 10 of these around work.
2. EASY TO BUILD -- I am hoping to build mine myself, and hope
that the (electronically aware) novices-to-be could build
their own.
3. Crystal control -- and I would hope to use a cheap uP crystal
for frequency control. This would keep all the transmitters
on a single frequency and eliminate off-frequency operation.
4. FM Modulation at about 500Hz-1KHz for audio code.
5. Low Power- part 15 type equipment.
6. 88-108 MHz operation so that standard FM radio could be used
as the "desk top" receiver.

One good thing, our building is fairly well shielded against external
RF, and located in an industrial park, so radiation outside the building
from an improperly adjusted set would not likely be a problem.

I considered the cheap "FM Wirelsee Mike + Audio Oscillator" but the ones
I have seen are completely unstable.
I had thought of using 32MHz canned oscillators, and selecting the
3rd harmonic at 96MHz, but how do I FM Modulate it?

Any info/help would be appreciated.
Thanks,
Ed Ganger KB4ORA

About ten years ago I purchased a self-powered converter which picked up
aviation band signals and ran them through my car stereo. You unplugged
the car antenna into the unit, which was about the size of a cigarette pack.
The unit had a shortwave converter which sent the aviation band into
the AM radio around station 1400 or so. It was manufactured by a fellow
in the midwest, but he died (Western Radio of Kearney, NE) and the stock
disappeared. I lost my unit when the car stereo was stolen.
Does anyone know of plans/kits for such a unit. It couldn't have been
that hard to do... cost was around $30 in 1984.

Hi all:

As a newcomer, just sending this to let U know abt. some activities
I'm involved here:
- 10.25GHz Gunplexers running video, WBFM and CW.
- TVRO and MMDS Donconverters conversions:
Intelsat K LNB to 10.25GHz(running)
PLL freq. stabilization at the same LNB(almost ready)
- C-Band CalAmp "Digiready" LNBs conversion to 3.45GHz(running)
- C-Band CalAmp "Digiready" LNB L.O. conversion to 5.7GHz Amateur band.
- C-Band CalAmp "Digiready" LNB L.O. plus freq. dblr/amp to 10.25GHz.
- Several CalAmp MMDS Downconverters conversions to 2.3GHz...2.4GHz
input, 440MHz output(runing, LNA under construction)
1.691GHz to 440MHz and 137.5MHz(Goes and Meteosat)(running)
- ATV at 1.2 and 2.4GHz using CATV modulators / upconverters(at the
bench)
- Running 3.2 meter and 1.2 meter dishes from 1296 to 10.25GHz
- Some tests with small loops antennas(HF subj, sorry)
I would like to exchange Info on such equipment mods, component
specification (inside this items - fets, bipolars, gasfets, MMIC),
celullar phone power moduler for re-use at 902>928, and so on.
Im placed at Sao Paulo, Brazil(GG66QJ) and planning some beacons
from 1.2 to 10GHz, .5W (CW, maximum, unknown ERP yet).

ACTUALLY, LOOKING FOR ANY INFO AT:

- CELLULAR PHONE PWR MODULE, LABELED FMC080802-20
- 2SC1251, A NEC TRANSISTOR, SUPOSE TO BE A CLASS A UHF DRIVER
- IF THERE IS ANY CODE TO SMD TRANSISTOR AND DIODES/MIXERS SIMILLAR
TO THE WE USE TO SMD (CAPACITORR AND RESISTORS).
- ANY SOURCE FOR SAW-FILTERS, 455KHZ OR 10.7MHZ, 40khz BW(NOAA/GOES/
METEOSAT DEVIATION).
- HRPT INFORMATION/SOFTWARE SOURCES.
- PATCH ANTENNAS THEORY (AND THEIRS YAGI-LIKE ASSEMBLY)

THANKS IN ADVANCE!

Gary, thanks for posting this. My only silkscreen experience was about twenty years ago when I printed my own QSL cards. I didn't realize photoresist could be applied directly to the silk. Neat.

>But if you need multi-color printing, then a machine is a good idea
>so that the registration for the color separations will be correct.
>Of course you can build this yourself.

I'm not familiar with the machine that you mentioned, but it should be possible to build an outer, hinged framework that holds the individually-framed screens. If the outer frame is clamped to the work and the frame and hinges are sturdy, I would expect registration to be very good. A full-length piano hinge or a pair of high quality self-retracting cabinet hinges would probably work well for this.

It's just an idea, but to keep the individual screens from moving around within the outer frame while the ink is being applied, dowels could be installed in the inside surfaces of the outer frame. If matching grooves were cut in the silkscreen frames, that would keep them centered in the outer frame, even if the fit between the frames isn't perfect. Also, if registration of multiple colors will be necessary, it would probably be best to cut all the wood for the inner frames at the same time. That way, the frames that make up a "set" will be more nearly idenical.

73,
Jack WB3U

2566. MICROSTRIP LINES - what are they and who sells them

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-20 00:00:00 UTC
From: litehaus@ix.netcom.com
Message-ID: <4lb8cg$t18@dfw-ixnews7.ix.netcom.com>
Source record: 105844

Hi fellow dxer's

Got my novice when I was 13...god awful bunch of years ago.

Recently I've been looking thru some broadband RF amplifier schematics trying to select one for a cable TV design project I received here at my work.

I notice that many of these have a "componet" shown in the circuit as a "microstrip" or "microstrip line." The parts list simply lists them as "Z1 = 0.31 x 0.15 microstrip."

What are these devices and who makes them? Even more important, who sells them?

Can anyone help me with this....please?

THANKS!!

Rich Potter
<litehaus@ix.netcom.com>

BTW..I'm wanting to build a 100 Mhz to 1.4 Ghz broadband amp. Any favorite circuits that worked out as a good experience for you that you's like to share...or even a suggestion as to which type of amp worked well. I've been reviewing (studying) about 10 different types of amp circuits. I don't need a super flat response..the 1+ Ghz is to be ready for the changes to cable tv that are comming in the near future (interactive games, banking, etc, even the Internet).

Thanks again!

2567. RFI from linear amp

Source record: 105845

I've got a homebrew linear using a pair of 3-500Z tubes. Lately I've noticed some RFI being generated from it -- a S2 hiss across the bands above 40 meters. This hiss occurs on receive only when the high voltage is on, making me think that it is a diode in the HV supply.

Does anyone know a way to spot the offending diode without replacing the whole bunch? I don't really want to poke around in a 4 kv supply when it's on. Ideas?

Yeah they often are, in fact it's almost standard practice. When
I order a 145.01 MHz channel element for a Micor, that's what's
going to be stamped on it, even though that's not the frequency
at which the crystal oscillates.

I use the following. I create the panel in a PC drawing program (CorelDraw, e.g.) using colors as appropriate, including the desired overall background color. I then take the disk to Kinkos and print it on one of their professional quality laser printers ($1.99 per page - and for many projects you can have 2 or more copies on that page). If there is a window, like for an LCD, I cut it out with a knife. Finally I have Kindo laminate the page. You ask for roll laminating, and the thinnest material, 2 mils I think. They have two thicknesses. Finally I spray the panel (not the laminate) with a shot of spray adhesive, available at hobby stores, and place the overlay. It works great, looks good, and is almost indestructible.

>Ron, w8gus.

Even easier, if you want to mess around ....

I reverse the bitmap before I print to a BW Laser printer on overhead
film. This puts the markings on the BACK of the acetate(? mylar?)
sheet. Then I mix up some clear epoxy and with a plastic spreader
I smear it all over the sheet and stick it on. With a little trouble,
bubbles are eliminated. After about 2 minutes (when the epoxy is gummy)
clean up with denatured alcohol.

Also, BONDO (car fixit goop) can be spread over the panel and the
plastic sheet set into it. I never tried spray adhesive, but it should
work. The advantage of BONDO is that it is a neutral grey and gives a
good background.

The big trick is to print MIRROR IMAGE of your panel onto the BACK of
your clear sheet. This eliminates any laminating step.

By the way --- It is important to use the ACTUAL PRINTER that you intend
to do your finish work on and make a "calibration sheet." Many printers
are not quite 1:1 and if your panel is 5% off, all sorts of things do not
line up well. (Most printers are within about 2-4% uncalibrated)

A micro-stripline is actually a PC Board trace cut to exacting dimensions over a ground plane on DoubleSided PC board.

It is important when making them to match the thickness and type (ie, Glass-epoxy, teflon, etc) of the PC board stock used in the article.

At VHF and up, this looks like a transmission line of some respectable portion of a wavelength (the length of the strip) at some characteristic impedance (the width of the strip). The shape, orientation, and termination of the line make it appear to be a fairly good L, C, or resonator at the frequency of interest. Some intrepid souls even make matching transformers this way.

There are computer programs to help design these things, and they are pretty much necessary. I have seen some RF guys just "seat of the pants" these things, and though they eventually get them working, it usually involves a lot of time with Xacto knives and copper foil.

Hope that this was helpful.

Regards,
Ed KB4ORA

> sells them?

You make them when you etch the pc board! Microstrip lines are distributed components, somewhat analogous to taking a piece of coaxial cable, slitting it along one edge and unrolling it flat, so you have a conductor floating over a groundplane, separated by dielectric. By varying the size of the line you control the impedance, and can make components that exhibit inductive or capacitive reactance at the desired frequency.

See, among other references, the ARRL or RSGB Microwave Handbooks for further details.

> BTW..I'm wanting to build a 100 Mhz to 1.4 Ghz broadband amp. Any
> favorite circuits that worked out as a good experience for you that

> worked well.

I recently built a broadband amplifier as the IF preamp for a 10 GHz WBFM rig, using a MAR-6 MMIC driving a MAR-3, with 1 nF chip coupling capacitors between them. I followed WB5LUA's suggestion of running them off an 8 volt bus (with the help of a 7808 voltage regulator) to make the power supply that much stiffer and more resistant to dying batteries. I laid out the microstrip (such as it is :-) with scotch tape and a straightedge, and drew in the DC stuff with one of the (in)famous Sharpie pens. It works fine.

Hi Doug,

Make sure that the 3-500's are fully CUT OFF during receive (ie,
drawing NO plate current). Idle plate currant can make a nice wideband
noise generator (this is the basis of one kind of noise generator in
fact).

Actually Spencer, you don't need 100 watts. All you need
is a good antenna and about 25 watts. I am experimenting
with EME now on 2GHz and am able to hear my echoes using
25 watts and a surplus 13 foot wire mesh satellite dish
antenna. You can get these antennas for a couple of hundred
dollars.

> as the "desk top" receiver.
Well Ramsey makes a FM xmtr for about 29 bucks...not xtalled controlled but at
FM BC freqs, you really dont need to worry too much....

You will have to inject a 1Khz toneinto the TX audio line inputs....
You could use the AC wiring as the antenna (using caps of say .01 or .01 in
series with the AC lead to the antenna out on the TX...I did that once with an
old RS FM mic and it covered the neighborhood)....once it hits a xfmr it wont
be going anywhere!

2588. Interfacing Knwd TV-502 2M xverter to TS-850?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-22 00:00:00 UTC
From: "Bruce R. Sawtelle" <bruces@isd.tandem.com>
Message-ID: <4leiee$a46@news.mpd.tandem.com>
Source record: 105866

I recently purchased a Kenwood TV-502 2M Transverter that I'm trying to modify (hopefully slightly!!) to use with a TS-850 HF rig. It looks like the -100V Sgreen Grid bias and the ALC signals are the ones I need to focus on, since the 850 is solid state vs. the TS-520/820 which the TV-502 was made for.

Any inputs on this would be appreciated!

73 & thanks

Bruce W3NJ

2589. RF software

Sorry This is the correct URL...
cut and paste it.

located at--> http://users.aol.com/maxfro/private/tunekit2.html

TuneKit for Windows

Filter Tuning Kit for Windows is a Electronic Filter Synthesis
program and a practical filter tuning aid for actually designing
and building a working filter. TuneKit is a small window module
with some powerful features that include;

1.) Chebyshev Lowpass and Highpass Filter Synthesis from 2 to 25
poles.

2.) Narrow bandpass Chebyshev Inductive or Capacitive Coupled Filters
from 2 to 8 poles.

3.) Bridged-T Notch Filters, provides rejection of 60dB or more with
practical values of inductor Q, using only 4 components.

4.) The Filter Data will be saved in ARRL Radio Designer 1.0 format
for instant Analysis of your design. TuneKit was designed to be
used as a front end for ARRL Radio Designer, There is a Stay on
Top Option button for repetitive filter designing while using ARRL.
(So, now you can Design and Analysis in seconds.)

5.) Calculates Air Core Coil Windings for a desired Inductance.

6.) Find the Actual Values of Inductors or Capacitors to use in your
filter's tank circuits, using the Resonant Frequency Calculator
and then save the values in the tunekit.ini file for instant recall.

7.) Fast access to the Window's Calculator, so you don't have to hunt
around your desktop. Opens as many as you want.

8.) Help Status Bar for On Line help of any Control in the Module.
Just press and hold and the status bar reveals the function.

That's most of the features in this version, future versions will
include Cauer Elliptical, Bessel, Linear Phase, Gaussian, Microstrip
Combline, Cavity Tuned, Interdigital, and etc. in module form.
Hope you find TuneKit useful as part of your Filter Tool Kit.

A new version of ezkitapp for the mac is available.

Ezkitapp is the Macintosh version of ezkitapp, the EZ-KIT Lite Host
Program. With this program you can communicate with and upload programs
to
the EZ-KIT Lite from Analog Devices.

version 1.1 - April 1996:
- added upload/download of data/program memory files
- added graphics memory map display
- added demo commands
- changed status window (looks better now)

it can be found at info-mac and it's mirrors:

[Archived as /info-mac/app/ez-kit-lite-11.hqx; 148K]

or in the macintosh hamradio archive:

file://oak.oakland.edu/pub/hamradio/mac/digital/ezkitapp_1.1.hqx

I have this rig in pristine condition. It is useless to me as it is, now
that I have moved to Denmark (CB is FM exclusively here)

I would like to convert it to 10 meter/28 MHz amateur band use, if
possible.

Has anyone tried this???

Schematics for the rig/mod anyone????

Regards

: haunts. Any referrals would be gratefully appreciated!

: 73 Dave WB0GAZ dgf@netcom.com

Hopefully this thread will go somewhere! I'd like to find more surplus
electronic ham places as well.

1. The last sat of every month there is the TRW ham swap meet. I think its
the corner of Marine and Aviation in Redondo Beach. All kinds of
stuff for sale.

2. For surplus, try C&H surplus on Colorado Blvd in Pasadena.

3. For (new) ham stuff there's Jun's in Culver City, or HRO in Anaheim.

Anyone else have good "secret" spots they'd like to let us in on ? :)

Later,

James KB6NYG

them
>for having an interest in paying a few bills.
>--
>73, Jay WB0VNE - AAV5TH

No, there is no "law" against it, but I pay good money for QST and other magazines. Instead of the author of the article having to pay for advertising space, their advertisement is presented as a technical article and the author either gets free advertising or actually gets paid to advertise! Instead of having to pay for promotion of their product, which would keep the cost of the magazine down, improve its quality, and allow for more editorial pages, the folks like me who subscribe to it are subsidizing this person's business.

In the case of most of the construction projects it is obvious that the authors are not going to get rich from it, and they have done a nice job of arranging the hard-to-get items in a reasonably priced kit. This benefits the readers, the readers benefit from the neat project, advancement of technical knowledge, etc. I have now problem with this, especially if the kit is offered in a paid ad in following issues.

The historical tube article was an out and out advertisement paid for by you and me. I see this all the time in trade publications I receive, but in that case I am not paying for them. When I pay for a magazine I expect the advertisers to pay too.

For those asking about the professional looking front panels for your projects, here is what i use and that works just great. I use a product called Masterpiece it's a metallic laser printer material with a self adhesive back. I use CorelDraw for the artwork, but other paint programs would work. Then i print it on my laser printer and have done many panels that look professional. The material comes in either Gold or Aluminum. I do advice a coat of clear spray to make wiping fingerprints of easyer. Be carefull tough not use a laqauer based spray, test it on a sample first. It's available at 1-800-A-PAPERS.

flegler@pilot.msu.edu (Stanley L. Flegler) wrote:

>Does anyone know the RF insulating properties of Delrin?

I have a catalog that shows specifications for Delrin AF blend as
follows:

Dielectric Strength Short Time (Volts/mil): 4,000
Volume Resistivity (Ohm/CM): 3x10^16
Dielectric Constant, 60 Hz: not specified
Dielectric Constant, 1 KHz: 3.1
Dielectric Constant, 1 MHz: 3.1

From the standpoint of voltage breakdown, this material is one of the
best. However, for overall electrical qualities, cross-linked
polystyrene is superior.

The facts seem to suppport your comments 100 percent Rob.

But I am more concerned with the technical inacccuracies presented. It is a much larger problem when fact are mis-stated to promote a product, even in a paid ad.

Technical articles should be based on fact, not hyperbole.

I am puzzled why more of us don't share that view.

-hello doug
this ones an old timer, i think you will find that the hiss is created by
secondary emmision i.e. the cloud of electrons straying from the anode/s
- you have in effect a broad band noise diode, remove the ht or change the
biasing arrangement
hope this was the answer 73's g8dqq

Warning, the following is NOT good engineering practice. Don't use it on the Space Shuttle. It's hobby kludge. Works at slow clock rates.

Take an ordinary NPN transistor, (2N3904 or better). Connect the emitter to the oscillator output. Connect a 1K resistor from base to +5V. Connect a 1K resistor from collector to +12V. Collector to CMOS input. If your clock can has a lousy high level, you may have to add a pullup from output to +5V. 1K is my favorite resistor value.

Works for slow clock rates. You can make it go a bunch faster with the addition of a couple of diodes and another resistor to keep the transistor out of saturation and Vbe reverse protection.. By that time, it's cheaper/easier to use a translation IC.

I am interested in building a 6 meter QRP setup for my own
experimenting.

While I have some old circuits, I was hoping to find some more upto
date designs using some of the IC's that I assume are on the market
today.

I am hoping to be able to make the transmitter and receiver more
compact (for backpacking, etc.)

Anyone have any ideas where I can look?

This is probably the result of diode noise generated in the tubes themselves. However, it's rare in my experience to encounter this except when an electronic T/R switch is in use.

Maybe you could describe the setup in more detail, particularly the means used to implement T/R switching? Do you cut off the tubes in receive, or do they draw idling current all the time? Also, how is your antenna system being fed?

Message-ID: <4liivl$8lo@mksrv1.dseg.ti.com>
Source record: 105895

Hey, old timers, I'm looking for some parts for transmitter projects I'm thinking about undertaking. I missed out on the "good ol' days" of vacuum tube homebrewing (I was licensed in 1977) so I'm living the "good ol' days" now! Here are some of the parts I need that I can't find locally:

National R-100 2.5 mH RF choke (need five of these)
Tube socket for an 807 (need one)
National XR-50 slug-tuned coil form (need one or more)

Does anyone have any of these parts they can spare me?
73 de KC5NG (Dean Hemphill, Lake Dallas, TX)

PS: I'm already running a one-tuber (with a 6T9 Compactron), that I built last year, based on a project appearing in the 1968 edition of ARRL's "How To Be A Radio Amateur". Four Watts on 80m and 40m CW... crystal controlled!

The Comm Spec boards work great, but if you are really interested in building your own, check out a company called MX-COM, INC., 800-638-5577.For example, the MX315 will do what you want.

From: rmd@ka4ybr.netmha.com
Message-ID: <4lijv0$60s@ka4ybr.netmha.com>
Source record: 105898

I've been thinking of building an AM TX for 160m and 80m and
not having any suitable transformers for modulating the plate
thought that just maybe I could do it by pulse width modulation.

Here's the tricky part, I want to do this with tubes.
Any suggestions?

I'd like to keep this fairly simple as far as the power supply goes
so it's gonna be 807 or 1625 or 6146 type final.

WHat sort of tube would make a good modulator for class D?
Any suggestions for turning the audio from the mike into PWM via tubes?

International Crystals 1-800-426-9825 asks you for both the channel and crystal frequency on their order blanks--presumably the channel frequency is what they stamp the crystal with.

Another way would be to just use a capacitor (0.1 uF a good start) between the can oscillator and the first CMOS gate. I would NOT use this method for anything serious without a great deal of thought, but for quick results it should work fine.
Most CMOS gates will self bias to about their transistion region if the input is left floating. Ac coupling the clock signal to this floating gate should swing the input about the switch point and get the signal into the system. If the input uses a Schmidt trigger, so much the better, but regular gates should work. If the first stage is an inverter, a 1 Meg resistor from the output to the input will bias it into the linear region without relying on internal leakage.
This will work best for higher speed oscillators > 100 KHz (?). The frequency should be high enough that the bias leakage will have minimal effect over a clock period. If the frequency is too low, the clock edges will be differentiated giving you probable multiple clocks. Also, at low frequencies, there is enough time for the bias to move the input dc level to the transistion region causing the circuit to chatter.
Expect higher current consumption since the first CMOS stage may alwaysould help here. Also expect increased sensitivity to circuit noise.

>
>A good source for good High Pass filters? Where do you find ferrite
cores
>these days? Any help would be appreciated. TU
>
>Lee

I can tell you a **poor source** for TVI filters, Tucker electronics.

The Tucker low-pass filter my friend bought was in a pretty looking, heavy case. But the case had paint on the cover mounting edges and insulating washers under the cover screws. It had long wire lead conventional disk capacitors and toroids as the filter element. The construction was unthinkably POOR for a VHF-UHF filter.

It had severe case radiation, and poor VHF-UHF attenuation. It actually CAUSED TVI in my friend's installation!

We replaced it with a jumper and TVI was reduced, we added an old Bencher and the TVI went away!

: works, but, boy, those rub off letters sure can be a pain to use.

: limited ability to set odd sizes for best fit as well....

Well, one thing you could do is create the image you want and
transfer it to 3M's INT ("Image 'n Transfer") film to create
a dry-transfer image of just what you want. Seems like a
rather convoluted way to do it, but it would get around the
problem you mention.

From: lenny+@pitt.edu (Joseph L Flatley)
Subject: Question about Motorola RF Transitors

sorry for the crossposting but I REALLY need help with this.

Ok I've just blown the SD1272 that is in the Ramsey PA-1 Kit. Now of course I'd like to replace it. I've heard that the Motorola MRF-239 can be used as a direct replacement of it but I'd like to know if there are any other MRF transistors that will give a higher output power. So if any of you have the Motorola RF Transistor book, I'd very much apperciate the specs on the MRF-239 and whatever other transistors I can use in the PA-1. thanks in advance

---

Hi Joe, the latest Motorola replacement for the SD1272 and MRF-239 is the MRF-1946A. Just like the MRF-239, the MRF-1946A is rated to provide 30 watts output with a 12.5 supply and a power gain of 10 dB at 175 Mhz (Class C). There is no higher power substitute from Motorola, all other conditions being equal. One normally would add another transistor stage having a lower gain to boost the power further.

Chuck, N2UCN

>N7UJU, Chris in Gilbert, AZ.

Hi Chris:

I have a Motorola RF Devices Data Book. The pinout was not listed along with
the device. I found it for case styles 2 and 3 in the case dimensions
section. The MRF966 is a style 1 case. I'll give you the style 2 pinout,
which is for a BJT. The MRF966 is a dual gate MES-FET.

1 collector
2 emitter
3 base
4 emitter
The long pin is 1. With the case face up the pins are numbered in a clockwise
fasion.
WARNING ! ! ! I can't garrantee that this is correct for style 1!

The MX315 is a very nice part and its under $5 in modest volume. Last time I heard MX-COM would sell low volume to those who are interested.

Also Ramsey makes at least one CTCSS kit, the one I'm thinking of uses the MX165 (or was it the MX365?) which encodes and decodes. Don't know how much the kit was.

>realize photoresist could be applied directly to the silk. Neat.

you can also photoprocess a sheet of gel, and adhere it to the silk.
its a fairly easy processs, and gives a little better resolution
for pc work. the name escapes me at the moment, but there is one
company that is real big in the field. they have an excellent line
of aluminum frames, registration devices, and so forth. a little
spendy for a one off hobby project, but will really pay back if you
are doing volume. wooden frames, vise grip type stretchers, and that
stuff is best left for qsl cards. check Thomas Register, as i'm sure its
listed. i'll post the name, if it ever surfaces in my failing neural
net.

2638. Anodizing Front Panels?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-23 00:00:00 UTC
From: Rex Hebert <hebert@linknet.net>
Message-ID: <317D67D2.4A44@linknet.net>
Source record: 105916

I've always wondered ...
How does Anodizing work? Whats the process?
I imagine it to be something like electroplating.
Can it be done at home for small project front panels?
Does it only work with aluminum?

Is there a FAQ that addresses this?
Thanks

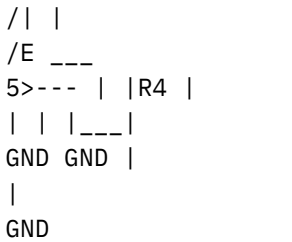
Everett, Washington

The tightwad's ICOM CI-V interface:
DB-9F
+9V

```
___
pin CR1 |
4 >--->|--------------------------------
CR2 | | |
7 >--->|------------ ___ |
___ C1 ___
| | R2|
GND |___|
|
|
|
C/---------------------------------------------> to IC-735
|/ | | --->
3>---|R1|---| Q1 | | |
| |\ ___/ | GND
| E\ +9V / ^ CR4 |
CR3___ | ___ | |
^ | | | |
| GND ___ GND |
| |R5 | |
GND |___| |
| |
2>------------------------\C |
\| |
Q2 |-------------|R3|---|
```



Parts List:

C1: .1 uf ceramic cap.

CR1,CR2,CR3: 1N914, or just about any silicon diode, good for 25V, 100mA.

CR4: 5.1V Zener diode.

R1,R2: 10K ohms

R3,R4: 47k ohms

R5: 1.5k ohms

Q1, Q2: 2N3904 or just about any small signal, NPN switching transistor.

Note that no external power is required, if the software supports it.
If the software drives pins 4 or 7 of the DB-9 high, they will supply the
voltage to run the interface. If the software doesn't do this, connect
a 9V battery or other supply to the +9V node.

Note also that this interface will work fine with *most* PC's, even though
it doesn't generate "true" RS-232 voltage levels. It's a little known fact
that most RS-232 circuits actually have an input switching threshold of
about +1V, and will respond just fine to TTL levels. (e.g. the MC1489
chip.) I haven't encountered any that won't work, though, in my limited
experience.

The loss tangent or dissipation factor shows how much RF energy is absorbed
by the material. Most plastics references only give a value at 60 Hz and
maybe 1 MHz. With most plastics the loss increases at higher frequencies.
The dielectric constant also changes with frequency, so you have to be careful
using handbook values for that also.

I'm not sure 3M still make it. It is/was like sheets of solid black
dry transfer material. You expose it through a line negative to
intense light and develop it with special INT developer, which washes
away the black where the film wasn't exposed to light. The result is dry
transfer material with whatever line pattern you want: lettering,
logos, block diagrams, smiley faces, Celtic lace patterns, whatever.

2645. QRP project

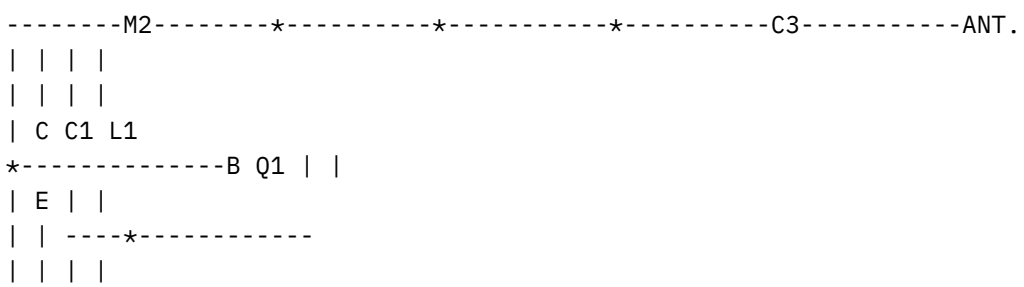
Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-24 00:00:00 UTC
From: nobody@haha.org
Message-ID: <2590.6687T906T2847@haha.org>
Source record: 105785

Hi Gang,
Here is the first of many very SIMPLE QRP transmitters. I make no claims to their performance! In the next few weeks I'll give you xmtrs for 80, 40, 20, and 2 meters; most requiring 3 or less transistors. The circuits come from 2 out-of-print ham projects books (c. 1968) so I will assume there will be no copyright problems.
Project 1 is a simple 40 meter xmtr; it should only take 15 minutes to build it (if you've got the parts). I wasn't able to draw the symbol for each part on this terminal, so I put the part number in it's place. Hope you don't mind... Note that the case of Q1 should be grounded. Here's the text for this project, taken from "101 EASY HAM RADIO PROJECTS" by Robert M. Brown, k2zsq/w9hbf and Tom Kneital, k2aes/wb2aai:

"Want to really shake up your next contact? Just tell him you are using this one-transistor CW rig! Most Novices and other hams shy away from these little gems thinking they are hopelessly underpowered. Not so! More than 50 contacts - all located over 75 miles distant - have been logged with this rig connected to the backyard longwire!
"Construction is quite simple and, in fact, there is not much to say about it. Reason: there isn't very little that can go wrong!
"L1 should be adjusted for maximum deflection on an FSM as the key is depressed. Crystal should be a fundamental frequency type for 40-meter operation."

Parts list:

C1 68 pF capacitor
C2 .015 uF capacitor
C3 10 pF capacitor
L1 25 turns of No. 26 enameled wire wound on a 3/8 in. slug-tuned form (National XR-91 or equiv.)
M1 4.5 volt battery
M2 40-meter fundamental freq. crystal
Q1 GE-9 transistor
R1 91K resistor



```
R1 GND | |
| C2 |
| | |
| GND |
| |
----------------------------*---------_M1+---KEY-------GND
```

That's it! Note that GND = ground (and note the polarity of M1).
For Q1, I've labelled its leads B = base, C = collector, E = emitter.
* indicates a junction of 3 or more leads.
Remember, no flames if it doesn't work; I'm just the messanger!
Project 2 will be an 80M VFO QRP xmtr; stay tuned. (Oh yes, there
IS a 2M xmtr on the way).

Six meter operators have found that solid state amps at
that power level create unacceptable IMD and interference on
adjacent channels. Signal levels in the local region and
on skip are so high that careful attention to signal quality
is essential.

A 4CX250B or other tube amp will give you a clean signal at
the power level you want.

I'm not sure what you mean either Joe, are you implying that Delrin,
conducts RF? I believe the original post was trying to figure out if he
could use Delrin as an insulator i.e antenna insulator, HV choke
insulator, etc.

I can not comment on the electrical characteristics but I have used
Derin successfully for antenna projects.

Another source of hissing is corona in the HV transformer or related components. In that case, it is a sign of impending disaster.

Usually it is shot noise in the tube, but it is very unlikely it would be loud enough to hear if the relay is working correctly and disconnecting the tank.

Perhaps he is using an electronic TR switch?

Ricky,

Do you have +/-12v and +5 available? If so, just use a 75185 from TI. Most electronics distributors have it. It should be around $1 to $1.50 in small quantities. It has a complete set of drivers and receivers for the PC side of the serial port. (Drivers for TxD, DTR, RTS; Receivers for RxD, DSR, CTS, CD, RI) I believe they also have a version with the opposite number of drivers and receivers for the peripheral side.

Also, check out the old standby 1489 (4x receiver) and 1488 (4x driver). (AKA 75189 and 75188 by TI).

All of these chips take RS-232 and translate it to TTL in the prescribed direction.

If all you have is +5v, then check out Maxim, Linear Technologies and Sipex. They have chips with charge pumps to create the 12 volt supplies by adding a few capacitors external to the chip. Likewise, if all you have is +12v, then use one of this type with a voltage regulator to bring its starting voltage to +5v.

I believe most of these companies have web pages, though I don't have any bookmarked. TI's is www.ti.com (I think).

Good Luck and 73

I think the question is something like, "How hot does it get when RF goes through it?" -- that is, what is its dissipation factor? Teflon, polystyrene and polyethelene are all quite low, but most other plastics are worse; Nylon is pretty bad.

Anyone have recommendations for good plastics to use in antenna projects? Tough, strong and low-loss... sometimes you need pieces that will be under tension, and not just in compression. Nice to be able to make fiberglass-reinforced moulded plastic pieces from low-loss plastics, but that's probably beyond the abilities of most garage shops.

>

I have used this method, but be careful not to apply the clear laquer too thickly in one go or the leteraset will start to break up. As I found out early on.

Another possibility is to cover the panel with some stick on laminate or vinyl. A realy simple way for smaller (under A4) panels is to prepare the lettering on a wordprocessor and print it onto an OHP slide, back to front if possible. Stick this onto a painted panel. Similar results can be obtained by using paper with a clear OHP slide in front, or if you want a "frosted" effect with a cut up A4 plastic paper holder in front.

With a colour inkjet printer and the expensive glossy paper you can make some really impressive panel fronts for about a pound each.

Rear panels, I do with a permanent marker pen. Simple and if you make a mistake it cleans off with alcohol (propanol or surgical spirit).

Remember, it is what is inside that counts, not how pretty the front is.

Mike

: Can it be done at home for small project front panels?
: Does it only work with aluminum?

Anodizing is oxidizing under power. Chemical oxidation always occurs at the anode in any electrochemical cell. The panel is made the anode in a bath that's normally chromic or sulphuric acid, with proprietary additives in commercial operations, I believe. After anodizing an aluminum piece, there is a layer of "porous" aluminum oxide on the surface. Typically it's 1/2 to 3 thousandths of an inch thick. After anodizing, it's optionally dyed some color (again with proprietary dyes) and sealed, to "close up the pores". Anodizing is only done on metals that form a tight, insoluble oxide: mainly aluminum and titanium.

CAN it be done at home for small projects?? Yes. Do you really _want_ to do it?? Probably not! Unfortunately, anodizing places usually have a minimum billing, like $50 or $100. If you just have one panel to do, you might be able to cajole or bribe them into doing it as a sample for you. If you insist on doing it at home, your local library should have, or be able to get, a book on metal finishing that will cover the basics of anodizing.

Some personal experience: alloys do make a difference. The Anadite shop in Tucson recommended that I use 2024-T3 to get a good, deep black. They were right. But when I had to change anodizing shops when I moved, I found that it was _very_ hard to find a shop that could do a good job on 2024-T3! Panels came back all pitted--looked terrible. Ended up having to _ship_ them to Anadite to get a good job.

I've built several single transistor amps using the MRF492 for 6 meters.
It is rated for 70 watts, 11db gain for 12v at 50 MHz. An amp is cheap
and easy to build in this configuration.
You could try using 2 MRF492's in a push-pull arrangement for close to
your desired output. I haven't tried this as I'm quite happy with the
70 to 80 watts that I get out of my single xistor unit and doubling
the power only represents 3db gain !
I once thought about using an old 11 meter amplifier on 6m by replacing
the push-pull MRF454's with the 492's but the cores used for the
impedance matching transformers are not rated to 50 MHz and will likely
saturate if you try it. You would probably have to play around with
different cores to obtain sucessful results.

had some of that as samples. there was a polyester base and metal base versions. make up your 1:1 artwork, overlay the material, run it through the exposure area of your blueprint machine on high exposure time and then develop with the chemicals.

was neat for prototyping, but i haven't seen it advertised in quite a while...of course the blueprint machine's been sitting out in the corral for a few years now and nobody's missed it yet. (once we had b-size laser printers, we almost never had to make "blue" prints again...i suspect the same is true just about everywhere where CAD has made inroads...)

Black is the most difficult color to apply evenly. Less adept
shops can usually apply other (lighter) colors without problems.

It's an N-Channel Dual-Gate GaAs FET, Motorola case 317-01, style 1.

The data book where I found it (Motorola RF Device Data, 1991) doesn't show the pinout for style 1 of case 317-01, just styles 2 and 3. The '92 Motorola Master Selection Guide also shows only styles 2 and 3. Maybe someone out there has an older data book or selection guide which shows style 1.

>Does anyone know the RF insulating properties of Delrin? Is it
>terrible
>or comparable with other materials such Teflon, polyethylene, etc?

Neither. Teflon, polyethylene (PE), polystyrene, and it appears, polypropylene, are quite a bit better than just about all other common plastics. Delrin, a trade name for a group of acetyl resins by Dupont, isn't as good, but it's still pretty respectable and better than most, at HF at least. The 59th Ed. of the Handbook of Chemistry and Physics gives a dissipation factor for acetyl resin at 1 MHz of 0.004. Compare this with PE at <0.0005, rigid PVC at 0.006-0.02, ABS 0.007-0.015, and Nylon 0.04. So it should be suitable for any but the most critical applications unless it has some obnoxious property like being hygroscopic. Note that the dissipation factor could vary quite a bit with the particular type of Delrin -- I only have information for the generic resin. The dielectric constant of 3.7 at 1 MHz is moderate, lower than some plastics but higher than PE or Teflon. This is a measure of how much capacitance it would add to nearby objects. A solid piece of Delrin would be markedly inferior to PE or Teflon for a coil form, since the increased capacitance would lower the effective inductance and hence lower the Q. I doubt you'd see much difference if the coil were wound on a tube of the material, though.

I don't know what happens to the dissipation factor of Delrin at higher frequencies. The microwave oven test will give you an idea of its performance at UHF and above. PE and Teflon (particularly Teflon) remain very good even at very high frequencies.

Here is the pinout for the MRF966: looking at the top of the device (the side with the printing on it), the leg which is longer than the others is the drain. Clockwise from this leg you have source, gate 1, and gate 2.

Sometime in the last 30 years(it was back when they had the small format),
Popular Electronics ran an arical on elctroplating and anodzing. While it
has been a long time ago, I still have a Bud-box that I dyed and anodized.
I used some blue Ritz dye, and the anodizing proccess used lye and I think
it used a dc power supply(something like 12v at 1 amp). If I get a chance,
I will try to check out the enginering library here at the University of
Knetucky, but that might well take a month or more. You can anodize
aluminum at home, but I just can not remember all the details. Maybe some
kind soul out there can check there own library and post the results.
The Bud-box still looks quite nice.

The correct current density is very important to achieve a consistent
anodized surface. An adjustable constant current source is required. You
want about 25 mA per square cm of panel surface (exact current density
and time varies with alloy, experiment).

For home use, RIT dye will work to color the panels. Use a hot (but
not boiling, about 140F) solution. Dip until you have the color you
want, then boil the panel at a rolling boil in clean water for about
10 minutes to seal the pores of the aluminum oxide layer.

2687. Saturn 6 tuning - HELP!!

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-25 00:00:00 UTC
From: darryl.linkow@grinder.com
Message-ID: <8BF5277.01A70009F4.uuout@grinder.com>
Source record: 105815

Hello all and thanks for reading this. I just acquired an old Saturn 6 antenna and am having a difficult time getting the SWR down below 2.5 to 1. I am using the MFJ-259 analyzer. I am just curious if perhaps part of the antenna is missing? There are two screws attached to a piece of phenolic board. I have attached the shield and center conductor of some RG-58 coax to these screws as the feedpoint. I am just curious if perhaps there is a tuning device (other than the capacitor plate adjustment) or a balun that should be connected to these screws on the phenolic board that might be missing? Also, might anyone have an instruction sheet or manual that came with the antenna that I might get a copy of? Any help would be appreciated.

2688. Seeking Dead Yaesu FNB-31 Battery

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-25 00:00:00 UTC
From: sgw@bigsur.eng.sun.com
Message-ID: <4log78$b3u@engnews1.Eng.Sun.COM>
Source record: 105816
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.swap

I am looking for a dead FNB31 battery for a Yease FT-51R. I am willing to pay for the shipping and give the person a few dollars for the trouble of packing it up. I want to use it as a dummy battery in the PA10 Mobile Charger, it will just be conducting the 12V DC for me.

Also if anyone has any info on a "Ear Mike" I would be very inerested in hearing about them. I need one for noisy conditions (convertable car).

Drop me an email and we can work out the details.

2690. HAM Equipment Available

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-25 00:00:00 UTC
From: Ted Spitzmiller <ths@lanl.gov>
Message-ID: <317FDD3F.167EB0E7@lanl.gov>
Source record: 105818

An elderly gentleman recently passed away and left his wife with
a whole shop full of a wide vcariety of HAM equipment. She would
like to have someone in the New Mexico area (or farther away if you
can travel) give her a token price for his equipment. She has no idea
what it is worth (and neither do I) but she would like someone to
make her an honest offer for whatever they would like have, and
perhaps tell her what might simply be junk so that she can
get rid of it without feeling like she is thowing away something
that might be useful to someone.

She is in Albuquerque.

Please call me, Ted at (505) 867-6824 evenings for details.

Thanks a bunch.

Ted

Bob,
Gary pointed out an easy system, because switching by-products are easy to
filter.

You'd better be building a single band transmitter if you are going to PWM
the PA. Spurious products at the switching rate that appear. They will
need to be trapped or filtered out, and a normal amateur type tank sure
won't do that!

What are you after, high PA efficiency or just eliminating the
transformer?

73 Tom

2697. SMD relacement for Amidon coil

Just connect your outside phone line to the "line" connector of your
modem and the rest of the house connects to the "phone" connector on your
modem card. That way, one cannot get a "live" connection whenever your
computer is on-line.

>different cores to obtain sucessful results.

A little off subject:

I'm currently thinking about trying the exact opposite - pulling the 100W amp from an old Motorola 50 MHz cop radio that I got for $25, and converting it to an HF amp. This should have less problems with transformers, and some negative feedback should be able to stablize the gain. Has anyone tried this? I'm sure there's plenty of details that would need filling in...

Another thought is to try to convert it into a 6m SSB/CW rig...

From: crscasio@pixi.com
Message-ID: <4lrink$m7m@rigel.pixi.com>
Source record: 105735

I am looking for Fluorinert. It's almost as hard as finding relative grease, or a fantail spanner.

Fluorinert is used in Mil-Spec equiment to draw heat away from components and transfer this heat to the heat sink. Fluorinert comes in gel bags of various sizes. No it is not the same as "Blue Ice". "Blue Ice" performs a different function, it is used to retain heat.

Thanks, Lawrence

if you are also into Photography you might look into a product called Liquid Light. It's a Liquid Photo Emulsion which you can apply to almost ANY surface expose as if it were photo paper develop and fix and have a permenant image after applying clear Laquer. I know "How do I get the negative?" easy you can do it several ways such as Drawing it and taking a Photograph of it then use that negative. If you have no Enlarger still no problem if you have a good Laser Printer, 300 DPI is ok tho the newer 600 DPI printers are better. Get yerself some Transparency Film made for Laser Printers and draw up the display in yer fave DTP prg then print it on the Transparancy film scaled 1 to 1 then simply do a "Contact" print by placing the Transparency film "Negative" over the panel which has already been treated with the liquid light emulsion. Turn on a Standard Incandescent Bulb on then off quickly and develop and fix. Voila'! Works great, I've done it, a bit grainy with my old 300 DPI Laser printer but for Text and a logo should be fine. Same Company also makes Silk Screening supplies as well. Company name is Rockland Colloid Corp in Piermont NY 10968 but any well stocked Photo shop should carry it. B&W developing is VERY easy too in a case like this.

According to the AIN Plastics Catalog, 1993, the electrical properties of DelrinAF
are as follows:

Dielectric Strength, short time, in air @ 73 deg F 400 v/mil
Volume Resistivity @ 73 F 3*10^16 Ohm-cm
Dielectric Constant
1 KHz 3.1
1 MHz 3.1
Water absorption, 24 hr immersion 0.2%
Saturation 0.72%

The AIA plastics catalog is worth having. Their phone number is 1-800-431-2451.

Hope this helps.

Don't know if there is a mod or not, but it should be stressed that
any equipment not designed for, and type-accepted, for marine use
is ILLEGAL to operate there. Emergency use aside, it's just not allowed.
Marine gear has very tight frequency stability and accuracy
specifications, specific power levels, and spectral purity requirements.

Well Bob I don't know Tom is talking about but, the only seccess I've
seen for class D is in audio amplifiers. If I remember right they pulse the
finals at 30 to 60 Khz and then modulate them.

I hope this helps a little

In article <577_9604230641@woodybbs.com>, Chris.Boone@106-4267.woodybbs.com (Chris Boone) says:
>You will have to inject a 1Khz toneinto the TX audio line inputs....
>You could use the AC wiring as the antenna (using caps of say .01 or .01 in
>series with the AC lead to the antenna out on the TX...I did that once with an
>old RS FM mic and it covered the neighborhood)....once it hits a xfmr it wont
>be going anywhere!

you might be able to just float the signal on the AC wiring, if this
is just in one building. some intercomms used to do that, and it worked
reasonably well for voice, so CW shouldn't be a prob.

3M makes Fluorinert. In fact, fluorinert is trademarked by 3M. Be
sure your wearing your seatbelt when they tell you the price! The
substance is expensive! The bags of flourinert made by 3M are called
"Liquid Heatsink". They work quit well, but again they are expensive.

2719. Protection for power supply

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-27 00:00:00 UTC
From: jiboulej@ce-csce.GRics.qc.CA
Message-ID: <199604271759.NAA01637@rtsq.grics.qc.ca>
Source record: 105747

Hello all of you,
I just finish my new power supply. Is is a simple thing but...it work and it is mine :-).
I may have a small problem. The transformer is a bit hight (about 50V) so there is about 75 volts on the capacitor. So the 3055 seem upset when there is a short!!!
The power supply work very fine and I can get from 1 to 50 volts from it.
Is there any method to protect the main transistor when there is a short at the output? I dont want to use fuse but I guess there is some electronic way to shut down the power supply when the current is to hight.
Thanks for any advice.
Jean
E-mail: jiboulej@ce-csce.grics.qc.ca

PS The power suplly is standard: transformer, 4 diodes, capacitors, reference for voltage and serie transistor.

Or if you are the experimental type, just build an audio oscillator
of the right frequency for the CTCSS tone required. Look in the
library for the circuitry for an audio oscillator, which is no
more than an op-amp or two and a few resistors and capacitors.
The CTCSS frequency should be easy to find. Just tune for the
right frequency and experiment. Good luck.

From: stevem@w6yx.stanford.edu
Message-ID: <4lttb6$eif@nntp.Stanford.EDU>
Source record: 105750

I am looking for a source for the dial belt material used by HP on some of their older instruments like the 8555 analyzer plug-in and 8620 sweeper etc. I've had some dial belts break recently. Even if replacement belt/pointer assemblies are still available from HP, they are probably very expensive. I would like to get a small roll of this belt material with sprocket holes. Does anyone know who the vendor is and what the part number might be?

Thanks

Source record: 105751

Dear Sirs,

Several years ago, I heard of a few homespunners throwing
together a Folger's coffie can and a simple circuit with an RF modulator
set at TV Ch. 3 and being able to tune into links between live news
broadcasts and their home stations. Granted, in the 1.7 - 2.6 Ghz range
one would have to be pretty line of site, however, it does seem possible.
I am quite interested in this kind of project as an
adventure/hobby of sorts, but can't find where to start. A search into
Yahoo turned up empty, and Alta Vista had only one site selling a pre-fab
'kit'. No adventure in a pre-constructed disassembled kit!
If you have any info or leads, please e-mail:
kieths@ix.netcom.com

Thanks!

-Kieth

2724. Code practice tapes and oscilator needed

Hi Guys!

My antique radio club is trying to put together an inexpensive regenerative radio kit for the new members as a first construction project. We have all the parts except the 0 - 140pf variable tuning condenser. We would like to buy up to 20 of these but will settle for 10 to get the new guys building right away. Antique Electronic Supply lists this part in their catalog but they have been out of stock for quite some time. If you have one or more of these for sale, please let me know via e-mail at keymastr@i1.net.

Thank You!

Hello! I've got some awesome news that I think you need to take two minutes to read if you have ever thought "How could I make some serious cash in a hurry???" , or been in serious debt, ready to do almost anything to get the money needed to pay off those bill collectors. So grab a snack, a warm cup of coffee, or a glass of your favorite beverage, get comfortable and listen to this interesting, exciting find!

Let me start by saying that I FINALLY FOUND IT! That's right! I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those schemes like multi-level marketing, mail-order schemes, envelope stuffing scams, 900 number scams... the list goes on forever. I have tried every darn get rich quick scheme out there over the past 12 years. I somehow got on mailing lists for people looking to make money (more like 'desperate stupid people who will try anything for money!'). Well, when I was a teenager, these claims to 'get me rich quick' sounded irresistible! I would shell out $14.95 here, $29.95 there, $24.95 here, and another $49.95 there. I had maxed out my new Circuit City Card AND my Visa...I was desperate for money!! So, I gave them all a chance but failed at every one of them! Maybe they worked for some people, but not for me. Eventually, I just tossed that JUNK MAIL in the trash when I got the mail. I recognized it right away. I can smell a money scam from a mile away these days, SO I THOUGHT.... I thought I could sniff out a scam easily. WAS I WRONG!! ....I LOVE THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating to GET CASH FAST!! I thought..."Here on the Internet?? Well, I'll just have to see what schemes could possibly be on the internet." The article described a way to MAIL A ONE DOLLAR BILL TO ONLY FIVE PEOPLE AND MAKE $50, 0000 IN CASH WITHIN 4 WEEKS! Well, the more I thought about it, the more I became very curious. Why? Because of the way it worked AND BECAUSE IT WOULD ONLY COST ME FIVE DOLLARS (AND FIVE STAMPS), THAT'S ALL I EVER PAY....EVER!!

Ok, so the $50,000 in cash was maybe an tough amount to reach, but it was possible. I knew that I could at least get a return of $1,000 or so. So I did it!! As per the instructions in the article, I mailed out ('snail mail' for you e-mail fanatics) a single dollar bill to each of the five people on the list that was contained in the article. I included a small note, with the dollar, that stated "Please Add Me

To Your List." I then removed the first position name of the five names listed and moved everyone up one position, and I put my name in position five of the list. This is how the money starts rolling in! I then took this revised article now with my name on the list and REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN BOARD MESSAGE AREAS THAT I KNEW. I then waited to watch the money come in...prepared to maybe receive about $1000 to $1500 in cash or so.... But what a welcome surprise when those envelopes kept coming in!!! I knew what they were as soon as I saw the return addresses from people all over the world -Most from the U.S., but some from Canada, even some from Australia! I tell you, THAT WAS EXCITING!! So how much did I get in total return? $1000? $5000? Not even!!! I received a total of $23,343!!! I couldn't believe it!!

I now have a brand new black Acura Integra to speak for, due to this!! Now after almost 8 months, I am ready to do it again!!! So maybe it was possible to get $50,000 in cash, I don't know, but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You must follow through and repost this article everywhere you can think of! The more postings you achieve will determine how much cash will arrive in your very own mailbox!! It's just too easy to pass up!!!

Let's review the reasons why you should do this: The only cost factors are for the five stamps, the 5 envelopes and the 5 one dollar bills that you send out to the listed names by snail mail (US Postal Service Mail). Then just simply repost the article (WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you can. Then sit back and, (ironically), enjoy walking (you can run if you like! :o) down your driveway to your mailbox and scoop up your rewards!! We all have five dollars to put into such an easy effortless investment with SPECTACULAR REALISTIC RETURNS OF $15,000 to $25,000 in about 3-5 weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR TODAY, EAT AT HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND INVEST FIVE

DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM NOW!!! YOU CAN'T LOSE!!

So how do you do it exactly, you ask? I have carefully provided the most detailed, yet straightforward instructions on how to easily get this underway and get your cash on its way. SO, ARE YOU READY TO MAKE SOME CASH!!!?? HERE WE GO!!!

*** THE LIST OF NAMES IS AT THE END OF THIS ARTICLE. ***

OK, Read this carefully. Get a printout of this information, if you like, so you can easily refer to it as often as needed.

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following: "Please add my name to your list". This creates a service out of this money making system and thus making it completely legal. You are not just randomly sending a dollar to someone, you are paying one dollar for a legitimate service. Make sure you include your name and address. I

assure you that, again, this is completely legal! For a neat little twist, also write what slot their name was in: "You were in slot 3", Just to add a little fun! This is all about having fun and making money at the same time!

2. Now fold this sheet of paper around a dollar bill ,(no checks or money orders), and put them into an envelope and send it on its way to the five people listed. The folding of the paper around the bill will insure its arrival to its recipient. THIS STEP IS IMPORTANT!!

3. Now listen carefully, here's where you get YOUR MONEY COMING TO YOUR MAILBOX. Look at the list of five people; remove the first name from position one and move everyone on the list up slot one on the list. Position 2 name will now move to the position 1 slot , position 3 will now become position 2, 4 will be 3, 5 will be 4. Now put your name, address, zipcode AND COUNTRY in position 5, the bottom position on the list.

4. Now upload this updated file to as many newsgroups and local bulletin boards' message areas & file section as possible. Give a catchy description of the file so it gets noticed!! Such as: "NEED FAST CASH?, HERE IT IS!" or "NEED CASH TO PAY OFF YOUR DEBTS??", etc. And the more uploads, the more money you will make, and of course, the more money the others on the list will make too. LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST AND BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE & AMAZING SYSTEM!!! You'll reap the benefits, believe me!!! Set a goal for the number of total uploads you'll post, such as 15-20 postings or more! Always have a goal in mind!!!
If you can UUE encode the file when uploading, that will make it easier for the people to receive it and have it downloaded to their hard drive. That way they get a copy of the article right on their computer without hassles of viewing and then saving the article from the File menu. Don't alter the file type, leave it as an MS-DOS Text file. The best test is to be able to view this file using Microsoft's Notepad for Windows 3.x or WordPad for Windows '95. If the margins look right without making the screen slide left or right when at the ends of the sentences, you're in business!

5. If you need help uploading, simply ask the sysop of the BBS, or "POST" a message on a newsgroup asking how to post a file, tell them who your Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try to describe how to do it but there are simply too many internet software packages with slightly different yet relatively simple ways to post or upload a file. Just ask for help or look in the help section for 'posting'. I do know that for GNN, you simply select 'POST' then enter a catchy description under the subject box, choose 'ATTACH', selecting 'UUE' and NOT 'TXT', then
choose 'Browse' to go look for the file. Find your text file CASH.TXT and click on it and choose 'OK'. Place a one line statement in the main body section of the message post screen. Something like "Download this to read how to get cash arriving in your mailbox with no

paybacks!" or whatever. Just make sure it represents its true feasibility, NOT something like..."Get one million dollars flooding in your mailbox in two days!" You'll never get ANY responses!

6. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE

CASH IS ON ITS THE WAY!! Expect to see a little money start to trickle in around 2 weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!! All you have to do is take it out of the mailbox and try not to scream too loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

7. So go PAY OFF YOUR BILLS AND DEBTS and then get that something special you always wanted or buy that special person in your life (or the one you want in your life) a gift they'll never forget. ENJOY LIFE!

8. Now when you get low on this money supply, simply re-activate this file again; Reposting it in the old places where you originally posted and possibly some new places you now know of. Don't ever lose this file, always keep a copy at your reach for when you ever need cash. THIS IS AN INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN CASH IS NEEDED!

9. (This step added by Charles Reiley). Hello, This is exciting isn't it?! While I'm on the list, just add a note saying "Please include extra money tips" with your name & E-MAIL address, and I will (FOR FREE) send you some neat methods to increase the money you will receive with this plan.
Why?... Why not? I'm not a selfish jerk...I like helping out others. E-mail just makes it a touch easier and cheaper, too! After I drop off the list, I can no longer offer you this advice, obviously, but maybe someone else who gets my tips will offer and simply replace my name on this step number 9. Good luck and give this plan your all, it will definitely pay off!
Like Mike said, HAVE FUN WITH IT!!!

I have thrown such a device together myself made from amplifier and mixer modules I pick up at the local ham flea market. ENG (from the trucks) and remote picup video from live events is all FM conforming to standards outlined in the FMTV section of older ARRL Handbooks. I would look at guys like Philips Tech electronics in AZ or HF technologies In IL for commercially made downconverters and FM video demods.

For my demod, I just use a modified satellite receiver. A couple of years ago, when Stanford University (just a few blocks away) hosted the world cup games, I was able to comfortably watch the video comming directly from the blimp above the stadium.

If I can answer any more questions, feel free to contact me via email.

In article <4lnqrl$r10@clarknet.clark.net>, designer@clark.net (Marcum N. Nance III) says:
>>You could use the AC wiring as the antenna (using caps of say .01 or .01 in
>I may be missing something but it seems a bit dangerous...

not really. the cap is isolating you from the ac, since it presents
a high impedance at 60 hz.

>Wireless intercoms that use the AC lines for their connection... can
>they be used in a simular manner if people attach a receiver to the ac
>lines?

yes, if i understand your question. that is how they work. there have
been a number of schemes for putting a low frequency (30 khz, say) signal
on the ac lines for switching or intercomm purposes. the biggest problem,
if you are looking for reliability, is all the other stuff, like fork
lift battery chargers, etc, that are also putting a signal on the lines.
but for casual morse code practice, it shouldn't be a problem.

2730. Low-power (transverter) output of TS-520?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-28 00:00:00 UTC
From: bruces@mpd.tandem.com

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.homebrew,rec.radio.amateur.space

Looking for the specs on the TS-520 when it's hooked up to a TV-502 2M transverter. I've successfully modified the transverter for receive on a TS-850, but there's nothing in the TV502 manual about drive input levels. THe 850 puts out 0-10dBm. Any info would be appreciated.

Thanks

2732. 4-1000A Grid Driven

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-28 00:00:00 UTC
From: turnerde@ccnet.com
Message-ID: <4lv4j5$j73@ccnet2.ccnet.com>
Source record: 105760

I'm considering an amplifier using the old 4-1000A, mostly because I have two of them. One of the disadvatages of these tubes is lower efficiency at plate potentials of 3kV and lower. Most designs use these in cathode driven configurations, probably because of circuit simplicity. I'm considering running one in a conventional grid driven mode in AB2. According to Eimac spec's a pair runs 3000 watts output with 4kV Vp, (I)idle 300mA & 1.2 A running, 500V Vscreen, -60 Vgrid and 140 Vpeak grid drive. Of course, a single would put out 1500 with half the idle and running current.

A passive input circuit has definate advantages. It requires NO tuned circuits and is very stable because everything is a low impedance to ground. Most of the time one sees this approach with Eimac external anode tubes, probably because of their lower control grid bias requirements. If one does the math for 140 peak (peak drive req'd 4-1000A in AB2), the RMS drive required with a 100 ohm passive input (not a bad match) is 138 watts. This is right in the ball park for most exciters and transcievers.

The trade-off in this approach is building screen and bias supplies, but NO input tuned circuits, input bandswitch and bifilar wound filament choke. The drive requirement is roughly the same as in the cathode driven configuration.

The question is simple. Does anyone have thoughts or experience as to this approach with this tube. Send some mail if you have thoughts.

Hi Frank,
If you have the part number, try sending a letter or call directory assistance for a place called 'surplus supply' or 'salvage supply' in Benton Harbor, Michigan. They had bought out quite a bit of Heathkit's parts inventory several years back. If your going to Dayton, they're always there. Now they sell a lot of Zenith computer stuff. Good luck.

From: eganger@mindspring.com
Message-ID: <eganger.123.07AA5DEF@mindspring.com>
Source record: 105771

Several years ago, I believe I read an article in QST about
using ANTIFREEZE in a can-tenna instead of oil. According to the
article, this would improve the dissipation considerably; apparetnly
the water in antifreeze was not of significant leakage (no pun intended)
to change the impedance appreciably.

Well, anyway, I made my own ONE PINT cantenna last night (I cant measure
the mismatch; much less than 1.1 to 1 at 2M) but the dry rating is
a measly 8W. I would like to add some coolant; I recalled the antifreeze
article and wondered if anyone out there has tried it?

I am a little worried about how water might affect the "flame-proof"
resistors. I feel that commercial antifreeze will not rust my paint
can what with all the corrosion inhibitors and whatnot that is in there...

If I can't be convinced about antifreeze, what other options are there
for a coolant?

Engine oil?
"mineral oil" from a pharmacy?
(I would _really_ like to stay away from oil though ... it is
almost impossible to clean up!)

Thanks,
Ed

>for voltage and serie transistor.

Ouch! 75 volts exceeds the 2N3055 emitter to collector breakdown
voltage (60 volts max), so when the output is shorted this baby
is going to go bye bye. The 2N3055 can handle 15 amps, so it
probably isn't overcurrent that gets it, it is probably overvoltage.
(The entire supply voltage is dropped across it when the output is
shorted.)

Lets see if we can fix both problems. A quick and nasty way to get
the unregulated DC down to a reasonable value is to put a resistance
in series with the *primary* of the transformer. An ordinary light
bulb can work well here. A 100 watt bulb would be about the right
size. That'll also work as a a crude overcurrent protector for the
supply.

There are more elegant methods, of course. You could use a shunt
pre-regulator to get the supply voltage down to under 60 volts.
And you could use a fractional ohm current sense resistor in the
emitter circuit of the pass transistor with a transistor connected
base-emitter across it and with its collector connected to the
pass transistor base so that it starves the pass transistor of
drive current when an overcurrent condition exists. Even more
elegant methods can be employed if you use an IC regulator to
drive the pass transistor base. But the light bulb should keep
the supply from destroying itself, and it is simple to do.
Make sure that there is always some load on the supply, a bleeder
resistor will do.

Our microwave relay transmissions are FM, so you can't just convert
them to a frequency your TV uses and watch them. You need a complete
FM receiver that decodes the video down to baseband and then remodulates
it in VSB AM for your TV. One of the game modulators will do for the
latter.

While we use NBFM (narrow for TV anyway), a TVRO receiver can be
pressed into service to receive the signals if you replace the
C band LNB with a 2 GHz LNB. The SNR won't be optimum due to the
wider IF filter used in the TVRO receiver, so you could fit a
narrower filter, or just live with the requirement for a stronger
signal. We operate in a 12.5 MHz channel while TVRO uses either
a 30 MHz or 40 MHz channel (C band or Ku band). If your TVRO
receiver has half-transponder capability, you're all set. We
use a 6.2 MHz FM subcarrier for audio, same as TVRO, so you'll
get audio this way too.

A coffee can feed can be used at 2 GHz, but better will be a
loop or disk yagi. Down East Microwave sells a suitable loop
yagi, or you can build a suitable disk yagi from a length of
all thread rod, some jam nuts, and fender washers (Nurad made
commercial antennas exactly this way, fitting them in fiberglass
tubes). Better still would be a 4 to 8 foot dish. We use all
four polarization senses from time to time, IE horizontal,
vertical, left hand circular, and right hand circular, so
a polarity switching system should be used. (A printed circuit
crossed dipole feed can be used as the driven element with
diode switched phasing lines printed on the board for polarity
switching.)

There are 12 channels in the 2 GHz band, but we only use 6 of them for remote pickups (at least here, the others are assigned to fixed relay), and those channels are shared among all the stations in the market. So there will often be signals on adjacent channels. Good filtering will be a must if your receive site is high and exposed.

We often use "bounce" shots, meaning that we use some common terrain feature in view of both the transmitter and receiver as a reflector. Often buildings are used for this purpose, but water tanks and even mountain faces can be used. What this means to you is that you may not need to be in the line of sight of the transmitter in order to receive the signals. We also often use our helicopter as a repeater, so that also lets you see things you might otherwise not be able to pick up.

You could try a simple polaplexer design, which is probably what you were thinking about with the coffee can, but the sensitivity will be poor, and results will generally be unsatisfactory. *And* much more importantly, you'll be *radiating a signal in the TV pickup band*, and that's a serious no-no. The FCC may not care anymore, but we do, and we've got the means and interest to hunt you down. Don't try this. Use a proper receiver design that prevents oscillator radiation. We don't mind if you watch, but we do mind if you interfere.

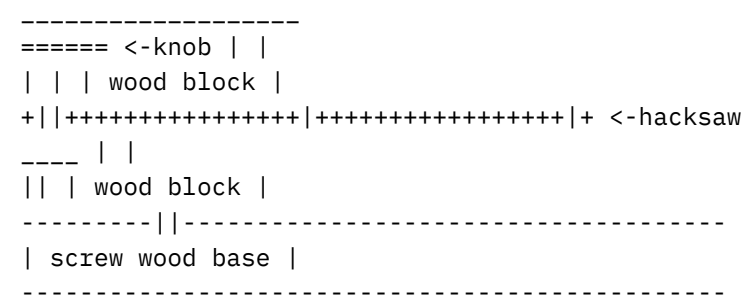
>to part with at a reasonable price, please let me know. I would really
>appreciate it.

Bill, since you obviously have access to a PC, one of the computer
training programs would be much better than a tape. Supermorse is
the usual favorite, and is available for downloading from many sites.
If you want tapes so you can practice away from the computer, you
can make your own using Supermorse. This has the advantage that you
can change the content of the tapes frequently. The big problem with
tapes is that you quickly memorize their content, so you want to
change the content frequently.

For a practice oscillator, the easiest thing is to use a piezo
sounder (available from Radio Shack for under $2) as the sound
source. Just key the power lead to it. Of course you could also
wire up a 555 timer as a code oscillator, but you'd need some
resistors, capacitors, and a speaker. The piezo sounder works
as is. A couple of AA cells will power it.

Now a good commercial key has gotten somewhat expensive, but
you can easily make your own from a broken length of hacksaw
blade, some pieces of wood, a few screws, and a drawer knob.
Here's one design:



Use a couple of long wood screws to fasten the two clamp blocks
down to the base, trapping the hacksaw blade between them. A
screw partially driven into the base forms one contact, the
screw holding the knob on forms the other. Before you drive the
contact screw into the base, adjust the amount of the hacksaw
blade that sticks out from the clamp blocks to get the tension
you like. Then drive the contact screw in the right place so

that it lines up with the knob screw when they are pressed
together. Hook one wire to the contact screw, the other to the
hacksaw blade. You can get the spacing you like either by
sanding down the bottom block or adjusting the height of the
contact screw.

This sort of key can be pretty if you're a craftsman, or it
can be ugly as sin, but it'll work in either case and costs
practically nothing to build. Just wire it up in series with
the piezo sounder and battery and beep away.

2750. mods for IC-2400A to 9600bd ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-29 00:00:00 UTC
From: vk2esl@vk2djg.une.EDU.AU
Message-ID: <6025@vk2esl.ampr.org>
Source record: 105679

Can anyone help me with this.
I have an ICOM IC-2400A duel band fm tranceiver and wish to
use it with a 9600bd modem.
Has anyone accomplished high speed mods for this radio or know
where I might find the info?

Thanks heaps
Steve.

2752. Building a voice radiolink from scratch: help!!

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-29 00:00:00 UTC
From: uc915@estud.unican.es
Message-ID: <4m2jib$aro@sci.cpd.uniovi.es>
Source record: 105681

Hello to all,
I would like to build in my free time a radiolink between two houses, about 6.000 meters far away. I am thinking on a simple FM transmitter and receiver built by myself, and directional antennas (mybe yagi). I have al ittle experience on building some circuits years ago (a 117 MHz VCO, a simple FM transmiter, ...), and now, there are some instruments (like a 2 GHz spectrum analyzer) that I can use for testing.
So, I would like to know about your (practical) experiences and opinions about that. The main problem (I think) is that there is not direct view from one point to the other: there is a little mountain in the middle, so the link must work using a difracted wave. Which is the best frecuency range to do that?

Any help will be very appreciated.
TIA.

I am interested in purchasing old mechanical calculators and slide rules.

I collect the old electro-mechanical "rotary" calculators that were made by Friden, Marchant, Monroe, and other manufacturers from the period of the 1900's through the late 1960's. I also collect non-electrical mechanical calculators and am especially interested in hand-held Curta brand calculators. I am not interested in adding machines that print on tape or electronic calculators.

If you have an old mechanical calculator or slide rule collecting dust in a closet, please send me an e-mail message.

Gang,

One word of warning on single tube/single transistor
and simple circuits. 99% of them will not meet the
FCC requirements for spectral purity on the output
due to lack of filtering.

You might consider finding the high dollar equipment
to measure the output.

It's your license at stake here.

Also, this may not be a problem now, but during the
next sunspot peaks you may get a citation for working
the high bands when you thought you were on 40M. :-)

Of course, you could make this a challenging project
for yourself to clean it up.

FYI

Source record: 105695

I recently arrived in Australia from the UK, together with UK standard Philips TVs and a video and I'm hoping to get them working over here. UK uses 6MHz audio, Australia has 5.5MHz (and a second audio channel at 5.75 I think). At the moment I can get video OK but the audio is not surprisingly very poor as it is right on the edge of the passband. I wonder if anyone has done this kind of mod and if it easy? I know if I purchase a local standard video it would be possible to use the SCART output from that, but I'd prefer to make full use of the equipment I have. The Philips TVs are models: 56KS3457/05T (circa 1984), and 15CE1010/05B (circa 1987). Currently I don't have circuit diagrams for either, but hope to be obtaining those by another route.

Thanks in anticipation.

I just did something similar. I'm almost done the AT-11 tuner from QST.
I did the front and rear panel layout with Corel Draw, created a mirror
image, and printed it on a transparency. then I spray painted toner side with
Krylon latex in a color close to the same as the cabinet front. It looks
pretty good, not up to my perfectionist standards, but much better than
anything else I've done.

I used Elmers spray adhesive to stick the transparency to the cabinet. Time
will tell if that was a good idea.

If I had drilled the holes a bit more accurately (my cheap drill press thing
isn't very good), and been a bit more careful with the paint (2 light coats
instead of one impatient runny coat) it would look a bit better.

The printed layout makes an excellent drill template too. Corel lets you
define the exact size of a circle, and place it in an exact location.

As a test, I tried some other spray paint I had (automotive I think) and it
dissolved the toner.

That's my first experience with trying to make a good looking project. Though
for the amount of time it's taken, I should have bought an SGC. <G>

Ed, mineral oil is usually recomended. Motor oil has a lower
flash point and antifreeze is toxic (don't spill any where pets
or children may lick it up). There are some new "green" antifreeze
compounds that are supposed to be non-toxic, but I don't know
how they would react with your resistor. We use ordinary tap water
with our high power water cooled loads, but they're designed to
use that (all ferrous parts are stainless). I can't say how your
resistor will react to water (ours are porcelain), but it sounds
like a cheap experiment, so why not just try tap water?

If you're worried about rust, paint the "paint" can first. And
if your tap water is full of minerals, use distilled water,
sold in supermarkets for steam irons.

>best frecuency range to do that?

The lower the better. You'll want a frequency where groundwave
propagation will allow the signal to follow the contour of the
Earth from one site to the other. In the US we have a license
free band from 160 kHz to 190 kHz with 1 watt of power allowed.
It would seem to be ideal for your situation if you are allowed
to use that frequency range in your country. Of course anything
from MW on down would be suitable. ELF transmission below 10 kHz
is unregulated here, and could be another good choice. Of course
you'll want to use a modulation other than FM at the low frequencies
since it is a bandwidth hog, and you won't have much bandwidth
to use. AM, SSB, or a digital signaling system would be the better
choices. At ELF, only the digital methods are feasible.

On the other hand, you might want to forego radio altogether
and try the sheet resistance method. This is very simple
conceptually. The Earth's surface can be viewed as a very
large sheet resistance. If you introduce a current flow
across part of it, some current will flow across all parts
of it (naturally decreasing proportionate to the distance
off the direct line path).

To do this, just drive two stakes in the ground as far apart
as convienent (the further apart the better) and drive them
with a large audio amplifier (a step up transformer on the
output is helpful as the distance between stakes grows larger).
On the receiving end, drive two more stakes, and connect them
to a sensitive audio preamp. Using a 100 watt audio amplifier,
and a typical phono preamp (with a good AC mains frequency filter),
a range of several miles is possible in rural areas. In urban areas,
there is so much noise from manmade ground currents that range will

be much less of course.

A carefully chosen tone frequency can be used instead of
voice, and that tone phase or frequency modulated with
a digital signal. If you choose the frequency to fall
between AC mains harmonics, you can apply narrow filtering
techniques to recover the signal at large distances despite
the presence of noise currents in the Earth.

I've taken the output of an auto radio (about 8 watts), driven
two stakes only 8 feet apart with it, and received the signal at
one quarter mile with just a pair of sensitive crystal earphones
connected to another pair of 8 foot separated stakes. This was in
very rural Kentucky, however, far from power lines. The method
also works across salt water.

Yes, an accurate voltage measurement across the load resistor is all
that's required to calibrate the meter for forward power. Needless to
say, the SWR indicated on the meter during this should be 1, and you
might also want to verify the exact resistance of the load. Checking
the calibrations for accuracy at both ends of the HF spectrum wouldn't
be a bad idea, either.

Mineral oil was the factory choice in devices like the Cantenna. I can
remember specifically reading warnings about not using motor oil for
this, although I don't remember the reason.

>(I would _really_ like to stay away from oil though ... it is
>almost impossible to clean up!)

Ethelyene glycol isn't much better and I don't know *anyone* who
has used it for this purpose (maybe because it's poison)?

My advice is to use the oil.

Hi Tim...I have a couple of small 8031 programs that I wrote for
Ham applications...a simple repeater controller, a beacon keyer...
Interested ?

Bob

I don't believe I would recommend class a class "D" modulator. The spurious sidebands that would be created would be awfully hard to suppress. If you want to do transformerless AM, I would suggest you modulate the screen.

Another neat approach would be to use an old filament transformer - 6.3v @ 10 amps connected backwards to one of these inexpensive aftermarket car stereo power amplifiers. Then you would have plate modulation and a good clean signal too!

I use Shell "Dial X" Transformer oil in my Cantenna. You might check with your
local power utility to see what they use in their transformers that is
enviormentally freindly.

Tim Hynde ka8ddz qrp/Rochester, MI (timhynde@ix.netcom.com) wrote:

: I just finished the simple swr meter from the W1FB QRP book, seems to
: concour with the commmercial units my friends have. Since your sampling
: forward and reverse power can anyone tell me how to calibrate the meter
: to read in watts or fractions thereof?

: I imagine you would measure voltage across the 50 ohm dummy but not
: sure if this is the complete meathod.

That sums it up pretty well.

Use a 50 ohm dummy load, scrounge a reasonable oscilloscope that
will cover the HF range and measure the Peak-peak voltage across the
load. Square the p-p voltage, divide by 400 and you get watts. Mark the
pointer positions on paper stuck outside the meter and make a neat scale
when you're happy with everything.

The original was published in "Sprat" number 61 and simply used two
meters, no pots. One showed forwards power, the other reverse. This is
much simpler to use, you can see forwards power peak and reverse power
null as you tune up your antenna, why bother working out VSWR?

You run RF through the thing backwards (power into the ANT connector,
dummy load on the input connector) to calibrate the reverse power meter
scale.

Cheers

Don Quinsland <dquinsla@connix.com> writes:
>Does anyone have plans for an old style crystal radio, using a galena
>crystal and cat's whiskers?

Here are two:

>I would like to have our scouts build a crystal radio set. Can anyone provide
>a set of instructions and or schematic. If you can help please E-mail me.

Practically ANY circuit containing a diode will work!

```
Antenna (the longer the better, depending on how close you are to a station)
|
| Coil wound on toilet-paper roll, with slider contacts for tuning
| |
| v
| & diode
| &<---+---------->|----+--------+
| & | | |
+---->& | | O high-impedance headphones
& =~200 pf 0.01mf= ) (8-0hms modern things
& | cap cap. | O will NOT work!)
| | | |
+----+----------------+--------+
|
Ground
```

If ~200 pf cap is variable (taken from an old broadcase AM radio, for
example), then only one slider on coil (to the antenna) is necessary.
Put a capacitor in antenna lead and can eliminate other slider, but result
is not nearly so homebrew. One CAN (and maybe SHOULD?!) MAKE (i.e., home-
brew) both capacitors: waxed paper or mylar and Aluminum foil.

The following came across the net some time back:

Someone asked:
> Anyone know where I can get a crystal radio kit? ....

Get a toilet roll with no paper on it. Wind 150 turns of 26-30 gage enamel
covered copper wire on the roll. At 50 and 100 turns make a bit of a twist
in the wire so that you can make a contact with it. You will have to
remove the insulation with a nail file or cigarette lighter. Make sure you
can make a good contact. Shiney copper. Connect the coil in parallel with
a 365pf variable air capacitor. I dont know where you buy these from. I
used to get them from old radios. Connect one side of an ear phone (which
MUST be high impedance; do not try to use a walkman type headphone. I found

that a receiver element from an old telephone handset works well.) to one side of the coil. Connect the other side to a diode IN914 (almost any diode will do). Connect the diode to the other side of the coil. Crystal radios need a decent antenna (~25-50 foot wire) and a good ground. The ground is very important. To alter the frequency range you can connect the capacitor to the taps on the coil at 50 and 150 turns.

Here is a postscript schematic of the circuit:

2783. electronic antenna tuners

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-30 00:00:00 UTC
From: efn002@email.mot.com
Message-ID: <4m54ku$dtq@brokaw.comm.mot.com>
Source record: 105711

Can anyone provide me some information on electronic antenna tuners
(products, design, or articles) ?

Thanks

Motor oil has a number of aditives some are not very good for you.

>>(I would _really_ like to stay away from oil though ... it is
>>almost impossible to clean up!)
>
>Ethelyene glycol isn't much better and I don't know *anyone* who
>has used it for this purpose (maybe because it's poison)?
>
Proplene glycol is use for antifreeze in potable water systems. And should
be safe.

Water is the best coolant but becomes conductive with very low levels of
contanmination. Also it has a very high dielectric constant about 80 compaired
to most things 3 - 7. This would seriously alter reactance of the internal
leads.

Checking the dielectirc constants for ethelene glycol it was 37 and propalene
glycol about the same. Minral oil was 3. So if you used antifreeze insted of
oil the internal capacitance would be ten times as great as if you had used
oil. This would probably not be much of a problem below 30 mhz but it would
start to be a problem at 2 meters for sure.

Good luck

Subject: CD4538BF Needed

Hello all,

I need CD4538BF in a large quantity. I have called Mouser and they only had
6 on hand and the part is now considered obsolete. Any suggestions where
I might find a ready supply?

Thanks.

I cut this from the Allied Electronics (phone: 1-800-433-5700) web site:

2787. Pebble Crusher - Output problem

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-30 00:00:00 UTC
From: timhynde@ix.netcom.com
Message-ID: <4m5245$ros@dfw-ixnews6.ix.netcom.com>
Source record: 105715

After building the swr meter and Pebble Crusher from the W1FB QRP book, I found that the power out of the TX was very low (~~10 mw) I started fooling around and removed some windings from the 31 turns of #26 on a T-50-6, this torroid is part of a filter on the output that comes right off the collector of a 2n4400, well, after removing about HALF the turns I had the power up to about 3/4 of a watt. (a bit more that the transistor is rated for I think).

Whats happening here? clearly the inductance is half of what it should be, I am testing into 50ohms using carbon comp reistors, the signal at my rx seems to be chirp free and clean. The circuit is tuned for 40m.

A "half-wave" filter as described in Hayward & DeMaw's _Solid State Design
For the Radio Amateur_ is very simple to design and build, non-critical,
and probably adequate to bring nearly any QRP rig into compliance when
tacked onto the output following the normal matching/filtering network. It
will also have negligible loss. It's good, simple insurance.

Roy Lewallen, W7EL

2789. Re: Pebble Crusher - Output problem

What are you using for a power meter? Keep in mind even the venerable Bird 43 will give inaccurate (high) power readings when a final is mistuned.
The fact that your power meter shows high power does NOT mean it is putting out power on your DESIRED frequency. It is possible you are mis-tuning the output to a harmonic or more likely into a state of oscillation which can produce overly high false power readings into a wattmeter. If you had access to a spectrum analyser you could easily see what is going on while you tune the output. If you have some sort of filter already set to 50 ohms and the desired output frequency then you could tune for maximum power out AFTER the filter and have some assurance the resultant power is at the desired frequency.

2790. Re: All tube class D AM TX any tricks. Any ideas regarding implementation.

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-04-30 00:00:00 UTC
From: tomb@lsid.hp.com
Message-ID: <4m5cqp$nbl@hpcvsnz.cv.hp.com>
Source record: 105718

Bob Duckworth (rmd@ka4ybr.netmha.com) wrote:
: I've been thinking of building an AM TX for 160m and 80m and
: not having any suitable transformers for modulating the plate
: thought that just maybe I could do it by pulse width modulation.

: Here's the tricky part, I want to do this with tubes.
: Any suggestions?

: I'd like to keep this fairly simple as far as the power supply goes
: so it's gonna be 807 or 1625 or 6146 type final.

: WHat sort of tube would make a good modulator for class D?
: Any suggestions for turning the audio from the mike into PWM via tubes?

What kind of tube? Something that can pull very close to "ground", or return its cathode to a negative voltage. And at fairly high currents... so, maybe a TV sweep tube would be a reasonable place to start, using 100 volts or so negative on the cathode. Why not power mosfets? You can get 1000 volt 5 ohm 3 amp parts for under $11 from DigiKey.

Generating the PWM is duck soup. Just build a clean sawtooth generator and compare its output with the audio, suitably amplified from the mic. It will be easiest for you if you design the system to be linear without feedback; putting feedback around a class D amplifier and keeping it stable is not trivial. You'll need to cleanly amplify and level-shift the PWM signal to a value to drive the grids of the switches (tubes/mosfets). Normally, you'd want a switch to pull to "ground" and one to pull (on the remainder of the cycle) to "B+". Driving the grid of the latter will be fun, since the cathode is moving up and down with the PWM waveform; and you'd better have a good floating filament supply! (The power mosfets really are easier to use! And they have much lower "on" voltage drops.)

An alternative all-tube AM rig _can_ be built from a pair of FM-modulated transmitters, with the audio that's fed to each generated by some magic I don't recall. You can use class C RF out to the finals, and combine the RF outputs. Maybe someone else will remember this technique and post a reference. I think it was outlined in "RF Design" magazine back around 1986.

Hi Clyde

You asked...
>Does anyone have any info on a Mitsubushi MD003, it is a 7 pin inline
>package that apparently switches RF.

The Mitsubishi MD003 is a solid-state RF switch capable of switching
up to 5 watts in the frequency range 800 - 940MHz.

Looking at the module, with the label facing you, pin 1 is on the left
hand side.

Connections are as follows :

1 2 3 4 5 6 7

GND RX GND BIAS ANT GND TX

With NO current into the BIAS pin (4) the ANT is connected to RX with
a loss of 1 - 1.5dB.

When you supply a current of 50mA into the bias pin (through a series
resistor) the ANT is connected to TX with a loss of 0.5 - 0.7dB.

I've been using the MD001 (400MHz version) in a design, with no
problems. Much better than using a mechanical relay, PROVIDING that you
ensure that you have good RF grounding arrangements linking ALL module
GND pins, and also proper decoupling of the bias pin on the module :-))

Hope this is of help.

>anyone has done this kind of mod and if it easy?

Hi John,

Your best bet is probably to contact a local Philips service center
and ask if there's an Australian version of those models. Depending
on the circuitry, you may be able change the SAW(S) and retune the
audio detector. That won't accomodate the dual-carrier audio used in
Australia though. If the boards in your equipoment lack the space for
additional components, you'll probably need to replace the equipment
to achieve full compatibility.

We used to get used transformer oil from the power company for free (for our homemade Cantennas). The PCB's were free as well. We used to get it all over our hands with no side effects (everyone has brown fur on their hands, right?).

Try vegetable oil. Perhaps you can boil off some of the H2O content? It is safe.

Forget the antifreeze.
Thanks and Best Regards,

Rick

From my perspective mineral oil from the pharmacy is the best choice for 2 reasons. The *most* important is toxicity. The mineral oil from the pharmacy is non-toxic (also indigestible). Note that the old transformer oil *was* toxic (it contained PCB's).

Ethylene glycol is *POISONOUS*!! In fact you do not want to spill it where the dog or cat or kids will get to it. It has a sweet smell that lures animals (don't know about kids) and they drink it. It causes severe kidney damage (or is it liver damage). When you do anti-freeze on your car, do it outside of the gagage away from everything else and wash down the driveway VERY well afterwards.

The second reason for oil is what others have mentioned about dielectric constant.

Hello Tim,

Currently I am building a VHF FM transciever with a 8032 microcontroller.
The microcontroller reads the inputs from a rotary encoder for tuning and
several buttons and switches. The outputs are several LEDs, a LCD display,
the PLL IC and a small RAM with a battery backup for memory channels.
It will also feature an external command interface based on the remote
interface as used by Kenwood. The code is completely written in C using a
cross compiler.

This is not a completed program but if you are interested let me know.

From: rst-engr@oro.net
Message-ID: <4m8820$h5g@hg.oro.net>
Source record: 105648

I'd like to build a good broadband noise source that is relatively
flat (say, within 3 dB in any octave portion) from a MHz or so through
a GHz or so. (Please, no 6J6s operating with starved filament voltage
-- I used that trick for the last time in 1960.)

Anyway, anybody got a proven idea using cheap parts that will let me
generate this noise? Amplifying the noise to a milliwatt or so is
child's play using the Minicircuits little 2-buck amplifiers, but the
old trick of using a zener biased at the knee isn't giving me quite
the flatness I want. It comes out more like a constant slope up to
about 50 MHz and then a constant slope down to a gig.

If I can avoid paying for one of those "special noise diodes" that
sell for $20 or so, I'd like to do it.

Thanks fer the help.

QST had an article in 94 or 95 about an easy to build good to 1500 MHz or so diode based noise source. NoiseCom was providing the diodes for ten bucks. They would calibrate the finished unit for 25 bucks. I did not have them calibrate mine so I cannot comment on the linearity. I can tell you that it generated plenty of noise at 1296.

I used the B-E junction of a BFR96S transistor in breakdown mode
with good success. Other RF transistors shoud do.

Excess noise was 15 dB if I remember correctly and it was flat to
at least 2GHz as checked against a HP noise meter.

Note that 15 dB is not enough for precision measurements since
you need at least a 26 dB resisitive pad between the noise source
and the device under test to force the noise generator impedance
to EXACTLY 50 Ohms both if switched on and off.

So sooner or later I'll end up paying NoiseCom the $20.

If you want really broadband noise why don't you just amplify
the thermal noise of a resistor? Go back to first principles and
calculate the noise of a resistor using Boltzman's constant at your
nominal operating temperature. Like you said, modamps are dirt cheap
these days and provide lots of gain up to several Ghz., so once you
know what your broadband noise output of the resistor is, just amplify
it to get to the noise power level you desire.

Calculate the noise power produced by a resistor of a given
value at ambient room temp in a given bandwidth. Then determine how
many dB gain you need after it to produce your desired noise power.
(Be sure to provide adequate isolation between stages in the gain
chain to prevent istability as you will be dealing with LOTS of gain).

Also, if you decide to band-limit the noise and put an LC filter
after the noise source watch out for saturation of the inductors if they

have a ferrite or powdered iron cores. I've seen a perfectly tuned bandpass filter put out a truly horridly shaped noise spectrum. The reason was that the aggregate power in the noise spectrum over a wide bandwidth (in this case about 40 MHz) was enough to saturate the cores and de-tune the filter.

I used this scheme to do some BER measurements on a satellite link and it worked quite well.

In search of my current Holy Grail, a higher performance receiver, I ask: Can anyone enlighten me a bit and perhaps give some article pointers re: what happens to signals on their way through crystal filters? It would be nice if there was a way to get somthing like "noise figure" and "output intercept" numbers, however crude.

The next question is... after processing through the crystal filter, is it worth worrying about noise, IMD and such in the IF amps, or does the filter turn your signals to mush, so it doesn't really matter as long as the amps are decent? I am aware of the practice of putting in another filter before the product detector to limit noise bandwidth.

The usual approach is to run the plate at DC ground potential. This requires a little different insulation around the Grid and Filament/ cathode which are now operating thousands of volts below ground reference.

Tygon tubing for a few feet and distilled water in the radiation loop do just fine in most applications, but there are HCFC's that are also used.

2822. Electronics Data Book to be released

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-01 00:00:00 UTC
From: qrpbook@aol.com
Message-ID: <4m8jqu$mbo@newsbf02.news.aol.com>
Source record: 105654

The Electronics Data Book for Homebrewers and QRP Yellow Pages is about to be released. The book highlights a number of popular QRP transceivers and also includes many data sheets featuring specific components as well as pages on capacitors, resistors and much more. It is a "must" for all amateur radio operators, electronics hobbyists and technicians. 192 pages spiral bound to lay flat on the bench.

The book will be released May 16 in Dayton at the QRP Symposium and will be sold in space 3405. Mail orders will be shipped May 16 (U.S.) and May 13 (foreign).

A special introductory price of $17.50 postpaid U.S. and $19.50 postpaid foreign will be in effect until 31 August, 1996. September 1 the price will be $23 postpaid U.S. and $25 postpaid foreign. Visa, MasterCard and Discovery cards accepted. Make checks payable to Five Watt Press. Colorado residents add sales tax. Colorado QRP Club members receive a $2.00 discount.

For order form by e-mail, send a note to QRPBOOK@aol.com or to Five Watt Press 740 Galena Street, Aurora, CO 80010-3922. Fax: 1-800-344-0740.

Dealers set to date:
U.S.: Gateway Electronics (3 locations)
Kanga U.S.

Europe:
G-QRP Club c/o G0OKY

Australia:
CW OPs QRP Club

Dealers will have books after the Dayton Hamvention.

If you have the ARRL Handbook, this book is a necessity. You will not find any other book like it.

My solution to the problem is cheaper and simpler... I just set my loss of carrier timer in the modem real long. I often set the computer up to do a long modem job, brain fade sets in, and I try to make a voice call. OOOPS! My ISP apparently also has theirs set long enough that I never loose a connection when I go stupid.

No doubt you are familiar with an AM diode detector. Add a BFO and you have a CW detector. That's the way my first receiver, a Hallicrafters S38 did it. If you check a transistor with an ohm-meter, it looks like two diodes connected together at the base. They are using the non-linear characteristics of the base/collector junction to generate the sum and difference frequencies of the LO (BFO) and the received signal frequency. All it takes to "mix" two frequencies is some sort of non-linearity.

Of course, all current transformer oil, at least in the USA, is PCB-free
(rather than containing free PCB...;-) -- you can likely get some
free or at low cost from your local power utility or a transformer
rewinding shop. I think it's safer than other alternatives which
could be much more flammable and not necessarily a good dielectric.

Try JAN Crystals. These folks have been around a very long time,
and have a super reputation. They do have an 800 number,

1-800-JAN-XTAL

About all you need is the model radio, and the frequencies
you are interested in. If, perchance, they do not already
have information on a specific model, they will let you know.

Good luck.

Are you sure you have to have Carbon Decomposition resistors? If Carbon Film will work, Allied Electronics has them listed at $14.75 per pack of 200 (5%, 2watt, p. 465 of the catalog). Their number is 1-800-433-5700 and are on the web at http://www.allied.avnet.com. Be aware that the have a minimum order (it's confusing, I'm not sure whether it's $25 or $50).

Haven't done business with them in probably 15 years, but they were good back then. Just happened to have their catalog handy.

Clark

P.S. There was an article a couple years back in one of the professional mags that basically said that carbon comp's change resistance with age, sometimes dramatically.

>Jack WB3U

The reason for not using motor oil is that it contains a detergent which will absorb water, decreasing the resistance and arc over distance of the oil. Use pure mineral oil. if water gets into the Cantenna, the water will collect on the bottom, and not cause as many problems as if it were absorbed by the oil. It seems to me that antifreeze would not be a good choice. If you can't get mineral oil, try hydraulic jack oil at an auto parts store. Most of the stuff I've seen is pure mineral oil.

Good idea, but where do you come up with the idea that you need 26 dB of pad?
This would calculate to a 52 dB return loss or an SWR of 1.003, but where do
you find a connector pair this good or even the resistors for the pad that are
that accurate? Hewlett-Packard does just fine with 10 dB on their 346 source.

Transformer oil is best if you can get a small qty. Mineral is fine but you have to de-rate the dummy load if you use high power (>500W) into it. Mineral oil doesn't stand up as well as xfrmr oil. The Cantenna has a chart for the de-rating. For the standard 100W rig, mineral oil is fine. I found it on sale at K-Mart for about a buck for a one pint bottle. The cashier gave me a wierd look when I bought eight bottles. Then I realized that mineral oil is used as a laxative...

Use of any other oil is probably not a good idea. Among other problems is that I believe that the additives in motor oil will attack the resistor. I wouldn't think antifreeze would be a very good choice either. It's toxic and really isn't a very good heat conductor unless it's diluted with water (a 60/40 antifreeze/water mix is supposedly best).

I think there's a discussion about this in the Handbook and in the Cnatenna manual.

I have a 4CW2000A which would be nice to use. This is a 4CX1000A in the water cooled version. The 4CW2000A has all the advantages of it's air cooled brother with the exception of water cooling.

Its' not easy dealing with water and high voltage together and few liquids have the heat absortion capability of H20. So, there are few, if any options. Distilled water has a resistivity of 10E6 ohm-cm. The tap water I've tested is on the order of 1E3 ohm-cm. Distilled water wouldn't offer enough resistance considering the short runs and high voltage involved. At the very least, it would present a healthy current draw in the plate circuit. Tap water is completely out of the question! This assumes that the cooling water comes in contact with ground, which is pretty much inevidable.

Another problem is that the cooling water is limited to 70C, so a boiler/evaporator lash-up isn't an option. Has anyone got a novel idea of how to get around this problem.

Have you listened at the harmonics of the oscillator? It's likely that most of the energy is at a harmonic, and cutting the inductance in half is letting it pass to the load. That's why the filter is there, to stop harmonic energy. Your power meter isn't frequency sensitive so it doesn't care what frequency the signal is on, but you should.

Source record: 105581

Hi Pierre-Andre;

I have not seen the circuit, but I suspect from your description that it is a regenerative, direct conversion detector, which is basically laid out the same as a common base amplifier. There is feedback in phase from the collector to the emitter, for regenerative amplification, mixing action in the base emitter diode, and emitter coupled audio output.

In the transmit mode, you would change the feedback either with biasing or thru removing the feedback capacitor. The Local Oscillator becomes the VFO, driving the output amplifier (now common emitter) at the same frequency as you were receiving on. The antenna remains coupled to the collector tank with no switching required. Sounds like a pretty sharp design!

> cooled brother with the exception of water cooling.

...

> Don Turner, WA6WRX

I have an Alpha 70 amplifier from the early 1970's that uses a 3CV1500A7 vapor cooled tube. Unfortunately, this tube is no longer available. The amp uses distilled water and Teflon tubing to isolate the B+ from the radiator system. The tube has a boiler top, a small connection for liquid water intake at the bottom of the boiler, and a large diameter connection at the top of the boiler for the steam.

Since I have only one working tube, I have been considering an alternative. Although an 8877 is a good match, I very much like the quiet operation of the water-based system and would like to use a similar tube. I would not mind having to add a pumping system for a water-cooled tube.

Are 4CW2000A's readily available, and about how much are they? Do you know of a water or vapor cooled triode in the same power range?

Or you can put a diac in each line.
If one phone is off hook, there won't be enough
voltage to turn on the diacs at the other phones on.
The end result being that you can only use one phone
at a time.

Run them the normal way. For cooling use distilled water or if in a cold environment glycol. Make a coil of tygon tubing about 6 feet long and the end away from the tube go to metal connector and ground this to chassis. If any leakage develops this will be your safety net. Also you can isolate from ground with diode and put voltmeter there to read leakage.

>anyone has done this kind of mod and if it easy?

Hi John!

I have made a modification to a JVC video a couple of years ago.
The vcr had to be modificated so, that both Finnish (5.5MHz)
and Estonian (6.5MHz) audio carriers could be heard.
If I remember right, we just added another (6.5) ceramic filter
parallel to the original (5.5) and that's it! Maybe I can find the
original instructions an send them to you. With this mod, you
can watch the tv through the vcr normally. But if you modify the
tv too, and if your tv has no video signal input, then the vcr's
rf converter should be modified and that is a more complicated
operation. With this modification you should hear both audio
channels at the same time.

Well, in removing turns from the toroid, you are tuning the filter for a higher cutoff frequency. If you put the cutoff up past the 3rd harmonic (3x whatever freq. you're trying to transmit), then you will see a power increase in a simple wattmeter as it starts to read the fundamental + the harmonic power. All amplifiers generate harmonics unless they're class A linears, and even those have small but measurable harmonics and intermod distortion.

This being the case, you might want to re-check whatever comes before the final amplifier transistor - it seems to be putting out a lot of harmonics, and not much fundamental. Maybe it's clipping the waveform?

Is this a crystal oscillator circuit? Maybe you have the oscillator tank tuned to the 3rd overtone of the crystal (3x the crystal freq. - it will usually oscillate pretty well there if tuned to that freq.) Add some capacitance to the tank and see what happens.

>Whats happening here? clearly the inductance is half of what it should
>be, I am testing into 50ohms using carbon comp reistors, the signal at

Nope, 1/4 the inductance. Inductance on a toroid is proportional to the number of turns squared.

Many RF/microwave transistors will give at least 30dB excess noise (ENR) in this circuit.

>
>Note that 15 dB is not enough for precision measurements since
>you need at least a 26 dB resisitive pad between the noise source
>and the device under test to force the noise generator impedance
>to EXACTLY 50 Ohms both if switched on and off.

For measuring low-noise amplifiers at VHF and above, you're looking for about 5dB ENR. This is normally achieved by adding 25-30dB of attenuation after the noise diode, and this attenuation also reduces impedance variations when the source is switched on and off.

To avoid measurement errors, the main requirement is that the output impedance says the same. It's less important that the impedance is exactly 50 ohms. Therefore it's best to choose a diode (or reverse-breakdown B-E junction) with a high ENR, because that allows you to add more attenuation which keeps the output impedance more constant.

If you use a constant-current source (adjustable around 10mA) and make the unit capable of operating from a pulsed +28VDC supply, it will plug straight into a HP or AIL/Eaton noise figure meter to get a cross-calibration from a commercial noise source.

>
>So sooner or later I'll end up paying NoiseCom the $20.

As someone else said, they have an offer to hams for $10. To get 5db ENR with one of those diodes, I had to use about a 7dB attenuator made from chip resistors on microstrip, followed by a good-quality commercial 20dB N-type attenuator. Thus the on/off variation in return loss is at least 54dB.

The noise sources in the QST/Handbook article use a clever polarity-reversing system to keep the output impedance more constant. However, this is only needed if you require lots of noise and cannot use much attenuation. Also it is not compatible with the industry-standard +28V system. If you need only 5dB ENR, you can do it the easier way like HP.

> Can anyone help ? Are there special instructions required ?

KISS does not support AX.25. It is simply a channel management and
modem management protocol. When you put the TNC in KISS mode, you
have to do the layer 2 protocol (AX.25 link layer, slip, ppp, etc)
via software running on the host computer.

In other words, it is the AX.25 layer that supported the connected
mode link. When you go into KISS, you are no longer doing AX.25 in
the TNC so the link is lost.

Several others have given a good explanation of the probable cause. In addition, the "power meter" is likely measuring the peak voltage. With the filter mistuned, the peak value can be much higher than it would for a sine wave, also inflating the apparent power output.

A very good practice is to build a "half wave filter" which will have low loss and quite good attenuation of harmonics, and always attach it at the input of the dummy load/power meter. Then you'll know what the power at the fundamental frequency really is, and you can separate the functions of filtering (provided by the half-wave filter) and matching (which is what you're adjusting). A half-wave filter is made of two cascaded quarter-wave filters, so called because its impedance transformation is the same as that of a quarter-wave transmission line at the design frequency. A 50 ohm quarter-wave filter is simply a lowpass pi network with all reactances equal to 50 ohms. When you cascade two of them, you can combine the center capacitors into one with twice the value. When terminated with 50 ohms resistive, you see 50 ohms resistive at the design frequency when looking into the filter. This is a very low-Q filter, so loss is typically negligible. I make mine with small (T-37, T-44, or T-50 for up to 10 watts or so) toroids of type 6 or 2 powdered iron, and dipped mica capacitors. Good quality ceramics or polystyrene should be o.k. too.

See _Solid State Design for the Radio Amateur_ for more information about this type of filter.

I was intrigued by your posting because it sounds a lot like something I played with about 20 years ago when I was in high school. HBO had just moved into the area with a transmitter on at tower at 2150Mhz and I lived in the foothills of the mountains about 30 miles away. I built an oscillator using a Motorola BFR90 (or MRF901?)transister and a small length of hard coaxial line, cut to the approximate resonant wavelength, the center conductor was then bent to fine tune the frequency and the output power of the oscillator. The output of this went into a double balanced mixer made using a stripline design on G10 epoxy circuit board. The output was fed directly into a TV tuned to channel 2, since channel 3 was active in my area. No need for any RF modulator since all I did was mix the microwave signal down to about 50MHz for direct reception on the TV.

I experimented with coffee can antennas and horn antennas. Sitting on a hill with line of sight, I was able get a watchable TV signal from about 30 miles away. But what I found most interesting was that driving around in my car with 5 miles or so of the transmitter I could receive generally good signals regardless of buildings and other obstructions (although with extremely rapid fluctuations in signal strength.) This made me think that with a proper diversity antenna system I could achieve reliable mobile communications at that frequency.

Just as I came to that point, I found that I had to get a job and carry on with my "real" life. So, it has remained an unfulfilled dream of mine. Recently, I have been living in Tokyo and purchased one of the new Personal Handy Phones. They transmit a digital signal at around 2GHz and are very effective within several hundred meters of the base unit. I guess my dream caught up with me...

I don't have any documentation with me, but I think I have pieces of prototypes in storage in California. Please let me know if you think I can help with any questions, and I would be interested in what you come up with.

2860. Grid Driven 4-1000

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-03 00:00:00 UTC
From: ky1sme@nbnet.mb.CA
Message-ID: <31896427.B6F@nbnet.mb.ca>
Source record: 105588

I read of others interested in a 4-1000A HF amp using untuned grid drive. I have been using coffee stained 4-1000's (meaning well used pulls) for years in grounded grid configuration, and the economy of grid drive mentioned by others appeals to me as well.

Rick, K1BQT, commented on the merits of grid driven tetrodes in the summer 1993 issue of Communications Quarterly. This was in conjunction with the introduction of cheap ceramic tetrodes of Russian origin. Svetlana, the US marketing firm, currently offers, free for the asking, reprints of that article and one other from the Winter 1995 issue by W6FR. These are general discussions, devoid of specific construction details. The new Russians tubes are about one half the cost of similar ceramic triodes and tetrodes offered by Eimac. However, like others, I've got a few 4X1's, sockets, and chimneys waiting to be put to use.

There have been a number of articles on cathode driven 4X1000's in the past:
5 Band Kilowatt Linear, W4OQ, Ham Radio January 1974
Ecology Linear, W7DI, Ham Radio March 1972
Separate KW Amps for the Contestman, K9LKA & W6SAI, CQ July 1969
The 4-1000A in Grounded Grid, K9KLA, QST July 1963
Build a KW Linear, W6DL, 73 Magazine

and probably many others. These I have saved over the years. These sources provide a wealth of practicle data on the 4-1000A.

The original Eitel-McCullough data for the 4-1000a listed the following typical operating specs:

CLASS C TELEGRAPHY

DC PLATE VOLTAGE 6000 VOLTS (6000 MAX)
DC SCREEN VOLTAGE 500 VOLTS (1000 MAX)
DC GRID VOLTAGE -200 VOLTS (-500 MAX)
DC PLATE CURRENT 681 mA (700 MAX mA)
DC SCREEN CURRENT 141 mA
DC GRID CURRENT 41 mA
SCREEN DISIPATION 71 WATTS (75 WATTS MAX)
GRID DISIPATION 6.1 WATTS (25 WATTS MAX)
PEAK GRID INPUT VOLTAGE 348 VOLTS
DRIVING POWER 14.3 WATTS
PLATE POWER INPUT 4086 WATTS
PLATE DISSIPATION 746 WATTS (1000 MAX)
PLATE POWER OUTPUT 3340 WATTS
OUTPUT CAPAITANCE 7.6 uuF

The 4X1000A is a hot tube! And they like voltage. I run mine at 5KV.

QST for May 1977 ran an article by W2AIH entitled "An Ultramodern Linear Amplifier". This was a construction article describing a 4CX1500B using an untuned input circuit terminating the rf drive signal in a 50 ohm resister. The author stated that the 4CX1000A could be substituted for the 4CX1500B with changes in grid and screen voltages. This points to some flexibility in the circuit. These tubes are low-voltage high current types designed for AB1 or AB2, so they are a breed apart from the 4X1000a. However, the general configuration should offer a starting point for an HF 4X1000a amplifier utilizing untuned grid drive.

Also in QST for May 1966, The Stanley Steamer, by W6MJG a vapor cooled HF Amp using a 4CV1500B with untuned input circuitry terminated with 100 ohms. And "High Power Linear" by W6HHN again using a 4CX1500B with untuned input circuitry and a novel grid bias arrangement. "A Low-Drive, High Power All-Band Tetrode Linear Amplifier" by KN5S, CQ for July 1990 using untuned rf drive circuitry with a 4CX1000A. Finally, "Compact AB1 Kilowatt" by W6KEV in QST for November 1957 using a 4CX1000A with untuned rf input using a 100 ohm resister.

And you'll want to read "Protecting Power Tetrodes" by KN5S in QST for November 1989. Also "Understanding Tetrode Screen Current", by W6EMD in QST for July 1961.

As time permits I'm going to start experimenting with untuned rf input and the 4-1000a. If your're just starting out with a 4X1000a, know that Eimac specifies .6 in of water back pressure for cooling. Read and Heed! They will last almost forever in amateur service if you keep it cool. This means you need a 5 or 6 inch blower three inches wide running at 3000 rpm. Is it noisy? Yup. You'll know you have too much air when the tube blows out of the socket.

Lastly, has anybody done this already???

Low Power EME Data Collection Experiments

de Mike, AF9Y

Introduction

The recent MoonNet discussions on low power EME has renewed my interest in development of an optimum waveform for the EME channel. Before the community settles on a particular waveform, we should first determine the channel characteristics. Important characteristics such as coherence bandwidth, selective fading and multipath are best determined by direct measurement with averaging over varying conditions. W3IWI, KA9Q and others have made astute theoretical statements concerning the impact of these perturbations on various modulation techniques. I believe there is an opportunity for the larger EME stations to collect data on the channel characteristics using their radio equipment and a PC equipped with sound card.

Data Collection Approach - Phase 1, Initial Experiments

For the first phase, we need recordings with the strongest signal possible via the EME path. The idea is to transmit various waveforms tailored to allow extraction of key channel characteristics. A one minute transmission is sent by one EME station and the resulting received audio is recorded at the second EME station. Post analysis of the recorded data should provide some interesting insight.

VE7BQH and I ran the first attempt at collecting data on April 28, 1996 using a PC program called TX55a. This program uses the sound card to generate audio waveforms that modulate the transmitter in SSB mode. I am releasing TX55a and its derivatives as a free public program. The program and the data collected from it is available from my webpage at: http://www.webcom.com/af9y.

In it's current form, TX55a provides the following:

- 1 Khz Tone (Transmitted every odd 4 second period)

This allows centering of the signal in the receiver passband and will be used as a reference signal during the test period.

- Narrow Band Spread Spectrum BPSK (Transmitted alternating even 4 second period)

This modulation is coded with a 63 bit Maximum Length Sequence (MLS) to allow extraction of channel delays beyond simple phase shifting. It is useful for multipath and channel coherence analysis. I

consider this waveform a candidate for weak signal modulation. TX55a transmits the "R" and "O" characters during the test. The main lobe bandwidth is 250 Hz.

- Multi Tone FSK (Transmitted alternating even 4 second period)

During this period, three simultaneous tones 1000 Hz, 750 Hz and 1250 Hz are transmitted. This waveform should provide insight into the selective fading aspects of the channel. Multi Tone FSK is a candidate for weak signal modulation and is being considered by W3IWI and KA9Q. The implementation of this modulation mode will likely require an update after W3IWI and KA9Q have had a chance to review it. I may not have captured their intent.

Data Collection Procedure

Lionel and I used the following procedure for the test:

1) Establish a 2mtr frequency just above 144.100 since this is SSB mode.

2) Using the program generated 1 Khz tone at the transmitter, tune the receiver for a 1 Khz receive signal

3) If available, rotate polarity for maximum signal. During our test, Lionel rotated his array through approximately 60 degrees during a 1 minute TX period of the 1 Khz tone. Using the FFTDSP42 program, the signal strength bar showed the best polarity position. This was an interesting side test that dramatically showed the advantage of polarity rotation. (I have include a picture of the results on my webpage)

4) Agree to a start time and record 1 to 2 minutes of the test transmission from the TX55a program. You can use FFTDSP42 to record the data as a WAV file. Just make sure the "R" button is red (active) and hit "SAVE" at the at the end of the test period before the signal image scrolls off the screen. If you are using another sound program for recording, I recommend you use a sampling rate of 8192 samples per second.

The stronger the signal, the better the analysis. I suggest that we strive for S/N ratios of at least 15 to 20 dB (100 Hz bandwidth). Each band will have different characteristics, so we need recordings for 144, 432 and above. If you email your recordings to me, I will post them on my webpage.

Dennis -

Looks like an interesting project! I haven't used the 4-1000A, but had one on the shelf for years and did think a bit about it. The main difference, compared to the 4CX1000A, is the much higher grid bias, and thus higher driving voltage. You will not be able to put 50 ohms directly across the grid. I think I remember that I once calculated that 50 ohms at the input jack, then a 1:4 step-up ferrite xf, would result in reasonable drive power requirements. Or instead, 200 ohms at the grid might be even better. You'll have to work it out. Maybe you'll need 1:9, I forget. The screen voltage used will greatly affect the grid bias setting.

One of the selling points for the single-signal, direct conversions receivers described in QST a few years ago was their clean audio - no disortion caused by a filter. I haven't quite finished building mine yet (another long-term project!) so can't give you an opinion based on experience.

>
>The way we do it is to use an Hewlett Packard HP5351B frequency
counter that works up to 26.5 GHz. A microwave spectrum analyzer
can also be used, but typically with less accuracy. There is a
divide by 8 prescaler that works up to 12 GHz in the DUBUS Technik IV
(German/English language selection of technical reports). It uses an
expensive $300 chip, so its not for everyone.

Amateurs typically measure frequency with receivers and marker
generators. You tune in a known frequency and use it to calibrate
your dial. Markers can be either "official" frequency stations or
lower frequency reference oscillators multiplied up to the receive
frequency.

Another method is to use a low frequency receiver and a down converter.
By carefully measuring the oscillator frequency of the down converter
before it is multiplied up, as well as possible receiver offsets between
the dial and the actual frequency, one can calculate the exact frequency
of the signal. The advantage of this method is the excellent
sensitivity. It is quite possible to measure a -140 dBm signal.

From: w8jitom@aol.com
Message-ID: <4mdeq8$bhv@newsbf02.news.aol.com>
Source record: 105602

Hi All,

The correct AB1 formula for a simple shunt grid resistance is: R= Eg^2 / 2Pdrv

A 50 ohm L pad can be calculated using ohm's law: .707bias / sqrt(p/50) = Rgrid. The input series R would of course be: 50 - Rgrid = Rs

With 90 watts and 56 volts of bias, 30 ohms of grid-cathode shunt resistance fed by a series 20 ohm resistor would provide both proper grid resistance and exciter loading.

Years ago I ran a pair of grid driven 4-1000A tubes, but scrapped the idea because of tuning and adjustment difficulties. AB1 grid driven amplifiers are tough to tune correctly, even the slightest amount of grid current or improper loading makes them poor IMD performers.

I eventually tried to run the 4-1000A's in the Collins circuit used in the 30L1, but was unsucessful due to less than sufficient catode to anode shielding. The only circuit that worked well was conventional grounded grid with screen and grid bias applied. There was some slight performance improvement over no screen or grid bias in grounded grid.

As with any tetrode, screen regulation and grid current in both grids was critical. As time passed I scrapped the 4-1000's in favor of a grounded grid triode. IMD performance and ease of adjustment improved greatly with this move.

Looking back on it all, there was almost no advantage for all the effort in building the screen and bias supply in the cathode driven 4-1000 configuration, althought it was easy to use and relatively clean even when slightly mistuned. The thing I wanted awas more power gain, but gain barely increased over a conventional grounded grid circuit with no screen or grid bias voltages.

The grid driven configuration gave greatly improved power gain, but was pretty fussy to tune properly on SSB. The largest problem was creation of IMD even when scope and meters appeared correct. I think the Collins circuit (used in the 30S1 4CX1000 amp) would have been the best circuit but the poor screen grid shielding in the 4-1000A's made regeneration a problem.

There are pros and cons to every circuit, and I guess the best choice depends on user goals. But the 4-1000A is a far cry from the 4CX1000 in operation and stability.

Hi Don,

At one point in my amateur building career, I was contemplating the idea of running a 4-1000 in AB2 service. The problem as I saw it was how do you compensate for the impedance change when the grid transitions from negative to positive values. I guess passive grid would work but I was never quite sure about that. I had considered using a cathode follower circuit to try to compensate for such transitions but lost interest in the project. Anyway, that sounds like a great project. I have my chassis down in the basement with the two tubes I purchased for it. (One to use and a spare for later.)

Speaking of tubes, a good friend of mine who was also into homebrew linear amplifiers is liquidating his supply of various tubes. 1- 4-1000 Condition unknown, 1- 3-1000 new in box, 6- 3-500Z's new in boxes. If you know anyone that is looking for any of the above tubes please contact me at: viking@pacifier.com

Thanks,

Bob East

Are YOU SURE the toroid was the correct one and not just the SAME
COLOR bought at a ham fest? BE aware, TOROIDS OF THE SAME
COLOR ARE NOT ALWAYS THE SAME TYPE!!!!!! Unscrupulous
vendors, mfg's and others have taken toroids and painted them. So
either buy from the manufacturer or besure you know where the toroid
came from. Best to use a GDP , some windings (look up in the ARRL
Handbook for an inductance & freq) then find the dip to be sure!
Hope this helps others from falling prey!

John N3REY

> where I might find the info?

My IC2400 is incredibly slow with rx-tx turnaround. In fact , its so slow that when i try to chat along at the local repeater in the rush hour, i find myself often talking 'stereo' with an other amateur, who thought the channel was free..

That, and also the fact that PLL modulated transceiver cannot be used for 9600bd packet usage, decided me to not even try te connect the 2400 to my packet system. The tx-rx turnaround time is even too slow for 1200 bd.

For 9600bd you need a turnaround time of at most 50ms. The IC2400 has more like 800 ms .

If you really want good performance on 9600bd, try to get IC275 / IC475 boxes. These are fast and give a very low bit-error rate. And they are expensive :-(

>(I suspect it's not to be confused with something like my daughter's
> Fisher-Price wind-up music box !?!? :)

No, this is a generator/clockwork that will power the SW receiver for about 30 minutes on a full wind-up. NO BATTERIES AT ALL!
The radio is so-so, the clockwork is fairly quiet, but seemingly only works for about 20 min on a wind-up. It is a neat concept; it is designed to get receivers into "under-developed" countries (read that as no 7-11 with spare batteries nearby) In those countries, the radio is quite a bit cheaper, and we, as "rich Americans" are subsidizing the cheap price in the third world.

I think I would like to have one of these "Baycomm" radios, as a conversation item... but for serious SWL I would get something else!

Source record: 105609

In article <3188E48B.792E@aol.com> Trenton Selah <Birdman870@aol.com> writes:
>
>Does anyone know if it is possible to convert a computer modem to be
>used as a terminal node controller for packet?

Yeah. Just open the modem case, remove the circuit board, and toss
it. Now make a new circuit board with the proper kind of modem, NRZI
to NRZ converter, SIO, PTT circuit, and the proper kind of microcontroller
programmed with the TNC protocol, and fit it into the box.

Most telco modems today don't support Bell 202, so the modem part
has to be junked and replaced. Packet uses synchronous signaling
rather than the asynchronous signalling used by telco modems, so
you need a NRZI to NRZ converter and a SIO chip. Telco modems don't
have PTT circuits, though you might kludge the on-hook/off-hook relay
to work. And I don't know of anyone who has coded AX25 for the Z8, so
the microprocessor needs to be replaced with a Z80 so you can use
regular TNC code.

Now if you can find an old Bell 202 half duplex leased line modem
with no smarts, you can use that with software in the host to emulate
a TNC, ala Baycom, but it won't *be* a TNC. And you can use a modem
that supports Bell 103 on HF, if you can trick the smarts to get out
of the way, again with software on the host to emulate a TNC.

But if you want a real TNC, there isn't much in a telco modem you
can salvage except the case and the wall wart.

I've just got one of these radios. Cost abt 65 UK pounds, but that
high price is to subsidise the cost of manufacture and make the rx
cheaper for developing nations. Radio circuit MW,SW (3-12MHz or
6-18MHz depending on model) and FM 88-108 or 76-108 (depending...) RF
performance only just adequate! Generator abt 3 volts at 50 mA. 150mW
max! One wind-up lasts abt 30 minutes independent of load ie.if you
have it loud it still lasts the same time. Quite rugged and abt size
of a shoe box (but mostly empty as market research in Africa revealed
that the 'punters' wanted a BIG radio!) US models are said to come
with mains power adaptor !!!!!!!!!

Hello friends:

My name is Francisco and I am located in Valencia, which is a sunny
and warm city in the East coast of Spain, in the Mediterranean coast
of the country. The Ham scene over here is very interesting as you can
find Hams almost every day in the VHF band making FM or packet, and
also a lot of friends keen on HF.

This message is because I would like to get schemas, draws, sizes and
way of construction on antennas for HF (easy vertical or wire ones,
but also mobiles for 20 or 40 meters), so if you can help you can
write by post to EA5VD Francisco P.O.Box 123 E-46080 Valencia SPAIN,
or by E-mail, but please see if you can help.

As I have seen in the last days there is some activity on Internet
with Hams (most of them from the States), but it will be of great help
to know about WEBs of interest.

Write back soon !!!!!

For a few bucks you can buy obsolete outdoor units from satellite tv systems
These things mix an input signal of 10.5 - 12.8 GHz down to 900-2000 MHz.
The accuracy is quite good. The local oscillator is stable and accurate to
30 - 100 kHz.

Because the downlink sattv band is getting wider and wider, the old
outdoor units (LNB's) wich only cover a 500-750 MHz piece of the downlink
are being replaced by newer types that cover up to 2 GHz (like 10.7 to 12.7GHz)

But if you have enough money to spend : take a look at EIP Microwave Inc.
counters. Much cheaper than HP.

CW encoding/decoding is a fairly useful workout, or even thing like the MFJ 'personal code tutor'. it'll give you some experience with the timers, lookup tables, and so forth.

or you could do a little DDS. the '51 can't really cut synthesis at a useful RF level, but audio output is the same technique, and a little easier to monitor.

2889. ITC Spectrum Analyzers

A few weeks ago at the Timonium hamfest I picked up an old HP5245L counter
and a 5255 3-12.5ghz plug in for it, for a total of $55. It works great,
if you don't mind the fan noise. And I kind of like the glow of the 8 digit
Nixie tube readout!

Cavity wavemeters, lke the HP 532, will get you within a few mhz. You should
be able to find these for $20-40. You'll need a diode mount for it too - another
$5-10.

BTW those old LNB's make pretty good 10gig LNA's, with a little tweaking.

Message-ID: <8312599377601@humnet.humberc.on.ca>
Source record: 105620

* Additional "stuff".

The other day a fellow posted a want for Ham radio related software for
the Intel MCS-51 family of microcontroller.
I had a few others who replied to my offer along with the original poster
of the request so I sent along some sample programs to all who asked.
One of them was Bob Headrick, WA7OVU.
Bob, I sent the repeater controller code as you requested however it
got bounced back to me as undeliverable from your end. I have your
e-mail address as: bobh@hpcvsgen.cv.hp.com
If you can correct me if I have it wrong or you have an alternate e-mail
address I'll gladly send it to you again.

* I also dug out a couple of other 8031 programs that I wrote for those
who may be interested...here's what I have:

1/ BEACON.ASM A beacon transmitter keyer. A good primer...yer' most
basic port toggling routines.
2/ RPTR.ASM A simple repeater controller with CWID, timeout timer,
courtesy beep and false keying detect.
3/ SYNTH.ASM An MC145170 PLL/VCO synthesizer controller used to
replace crystals on a lowband GE Mastr Exec for 6m. The core of
talking to the synthesizer chip is the importance stuff here.
4/ BLKBOX.ZIP A controller to use Kenwood TM-741/742 RF modules as
standalone transceivers. This one is available from the ARRL
FTP/Web site from an article in Dec.'95 QEX.

All code written in PseudoCorp's PsuedoSam(TM) 51 assembler syntax but
conforms to and/or is easily modified for use with other assemblers.
I write this stuff for fun so no guarantees of integrity and no claims
to being the world's most proficient firmware author however all
programs have been tried and used. I might as well share them rather than
keeping it all hidden on my hard disk if it can be of help to someone.
Oh yes, I also have a beacon keyer program for the PIC micros if someone is
curious. (I'm now learning how to 'speak' Motorola !)

E-mail me if interested: hduff@humnet.humberc.on.ca

Yeah, you can do this is you don't mind massive RFI.

Putting diacs (or diodes) in the phone line is not a good
idea if you operate HF. (Or if your neighbor does.)

Only a problem if one doesn't take measures to deal with the RF.
A bit of 'C' will do in most cases.

> Your help will be very much appreciated. Thankyou.

You've got a misconception as to the function of KISS mode. The purpose of KISS is to provide a way for a computer and software to be able to manage the mechanics of the connection, with the TNC providing only a minimal level of intellegence. All the TNC does is:

1) accept packets from the host computer and send them on the air, while making sure the channel is clear before keying the radio.
2) receiving all packets on the channel that don't have errors and passing all of them to the computer for it to process.

So - to use KISS mode, you have to have software running in the computer that implements the layer 2 protocol you wish to use on the air (typically AX.25). It can also implement other protocol layers above 2 by wrapping those packets in the layer 2 protocol. This is what KA9Q NOS and its variants do.

So - to summarize, a TNC in KISS mode does not exhibit any significant level of intellegence - the reason KISS is available is for those who wish to have the computer perform link management activities - i.e. do all the work...

Hope this helps.

I think an Intersil 8038 would be a VERY GOOD part for this.

It is an RC oscillator with VCO, and triangle to sine wave
converter onboard. It is about $5 in onesies.
1 RC sets frequency, 2 R's set sinewave distortion level ...
untrimmed it is about 2% if i reall right, adjustable to
less than 1% (but who cares for PL).
You can get it at Jameco, and I think DigiKey has it in stock
as well. It is the chip that the less expensive sine-square-triangle
function generators are (is?) based on.

Actually, the inductance is about a -quarter- of what it should be.

L is related to the -square- of the turns if I remember right.

In general, when building from a set of known-to-work plans, it's best not
to modify component values by 400% as your first troubleshooting step.
The problem is probably elsewhere.

Good luck!

2902. Re: Measuring Microwave Frequencies

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-05 00:00:00 UTC
From: lhalliday@creo.bc.CA
Message-ID: <9604058313.AA831333415@mail.creo.bc.ca>
Source record: 105534

There was an interesting microwave frequency meter that used harmonic mixing in VHF Communications 3/1995.

The idea was to apply the incoming signal to a mixer, along with a tunable oscillator in the 500-1000 MHz range. Tune until you detect an IF signal, and make a note of your LO frequency and the IF output frequency. Shift the LO a small amount and note the amount by which the IF output frequency shifts.

Dividing the two shifts will tell you which harmonic of the LO is involved. The direction of the shift will decide USB or LSB. The design used a microcontroller to tune oscillators and do the arithmetic.

The result is 100 Hz resolution to many GHz, limited only by the frequency response of the mixer diode (and its mounting). The author had tested it to over 30 GHz and was looking for diodes that would go higher. An automated, generalised machine is a formidable undertaking, but I've used similar techniques with a tunable oscillator, a frequency counter, and pen and paper...

If you'd like to use this circuit, all you'd have to do is pass the output through a simple lowpass filter (couple of caps and a resistor) to change the square wave to a semi-clean sine wave.

They (ITC) are still advertising in mags like Mobile Radio Technology. I've had a little touchy feely
with the units and they didn't play too bad. This was at a demo at a ham fest.

For my money, it would depend on what I wanted the unit for. If I needed portability, I'd buy the ITC.
But for all round bench work, the 141T/855x units are the best for the money. I have a 141T/8552B/8556A/8554B setup and wouldn't get rid of it for any money.

I wonder if this problem might be negated with a
simple microprocessor controlled tuning circuit?

A microprocessor might even be useful for grounded grid
amps--perhaps to automatically tune the input circuit with
relays. This could allow a higher Q PI input circuit without
having to worry about excessive mismatch to the driver.

> The grid driven configuration gave greatly improved power gain, but was

> problem.

The extra power gain is quite useful if you are
attempting to generate the cleanest signal that
technology allows.

Solid state class A driver amps can have good
high order IMD performance, but become impractical
much above the 10 watt level.

As Tom indicates, you want to use the best parts
for the job--which isn't always practical for those
on a budget. For instance, I've noticed that you
tend to get better IMD with higher voltage tubes.

What do you do if you only have a 2 kV supply?

Start over and get parts for a 3.5 kV amp?

Jeff,
I built a tone encoder many moons ago out of a 555. It was very
simple and not filtered very well so it wasn't exactly "subaudible".
Most repeaters passed the tone a little bit. It was a square wave so
you couldn't turn it down as far and still have the decoder recognize
it. Any data sheet or Radio Shack book will tell you how to do it.
BTW, I used it on 110.9 mostly, but tried it from abt 80 hz to 150,
worked fine.
Good luck,
Kerry

Hugh:
The TRC-509's, single channel HT's that Radio Shack sells has separate
RX and TX crystals plus a 10.245 crystal for 2nd IF.
I have done the conversion and hope to get final writeup on how I did it
in the next couple of weeks posted.
Mostly it is merly a crystal and tune up to the unit is all it needs.

2915. Radio Station Database Program Stand Alone

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-06 00:00:00 UTC
From: Charles Bolland <chuck@flinet.com>
Message-ID: <318E27BD.1D66@flinet.com>
Source record: 105543
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc.,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,rec.radio.noncomm,rec.radio.scanner,rec.radio.swap

Sir,

It's still available. The IBM/DOS Broadcasting Radio Station Database Program for Longwave, Mediumwave, and Shortwave. Over 4,000 records included already. The program is completely read and write. Records can be added or changed. Sorts in many different formats both on your screen and printing.

If you would like a copy of the program, send your request to "chuck@flinet.com". Please include your MAILING ADDRESS - SNAIL MAIL. For example, your street number, city, state and zipcode. Also include your EMAIL address.

The program will be sent to you via EMail probably within 24 hour is not sooner. If you reqeust the program and havenn't received it in that period, check back with me. Sometimes things get lost on the internet.

Remember to send your address. Requests without a mailing address will not be acknowledge to save time on the internet. In the past requests without an address were reminded with a message. Usually, the reminder went unanswered anyway. If it wasn't, the reply was sometimes very rude.

This program is FREE! Everything works. It has many features and they all work, not like shareware where some of the features work and other don't.

Your Postal address and EMail address will be kept CONFIDENTIAL. I may in the future contact you via Snail mail with a description about the Voyageur Database program. That's it.

Hope to hear from you and best regards.

Thanks for the reply Mark. R/S has a TRC-505 on sale up here in Canada
and I was thinking of picking one up. I will assume it has a similar
scheme to yours...unlike the old 27 MHz toy WTs that used an LC circuit
on RX.
Where did you get your crystals from and what were the specs
(3rd overtone, series or parallel cut, loading capactiance... ?)

Thanks again..Hugh..

Source record: 105545

In article <3189FC93.3571@arrl.org>, zlau@arrl.org says...

>Another method is to use a low frequency receiver and a down converter.
>By carefully measuring the oscillator frequency of the down converter
>before it is multiplied up, as well as possible receiver offsets between
>the dial and the actual frequency, one can calculate the exact frequency
>of the signal. The advantage of this method is the excellent
>sensitivity. It is quite possible to measure a -140 dBm signal.
>
Another source for a cheap downconverter is a radar detector. My Uniden
detector uses a DRO, much like the X-band satellite converters. I bought it
at Wal-Mart for $30...

H>no real description. Anyone know what this is all about ?
H>(I suspect it's not to be confused with something like my daughter's
H> Fisher-Price wind-up music box !?!? :)
```

Not at all. It's being manufactured in South Africa for 3rd world countries. Batteries are very expensive (something like a days pay) and this radio doesn't require batteries. I have sent for the brosure and will e-mail you when I get it. They were also talking about a wind-up flashlight and wind-up computer. You wind up a spring and it turns a small generator inside.

2919. WABASH INDIANA HAMFEST HOMEBREW CLASSIC 701A KILLOWATT AMPLIFIER

Newsgroup: rec.radio.amateur.homebrew

Source record: 105547

I saw a real nostalgia item yesterday at the Wabash Indiana Hamfest. It was already sold when I saw it, or I would have probably bought it myself! I hope whoever bought it will both appreciate it and have fun with it.

I wonder if anyone on the net knows anything about its history, and who built it. It was very well done. - a pair of WE701-A tubes, with blower, chimneys, B&W Pi-net, 6KV tuning capacitor, and 4-866 rectifier tubes mounted in a small rack which had the top half, sloping panel space empty. It had a very heavy plate transformer in an odd, flat, circular configuration.

Whoever built it up did a very good job. I suspect that some of the shielding panels had been removed. At any rate it was neat to see an actual implementation of the WE701-A. Years ago every surplus store had a 701 hanging in its shock mounting shipment frame in the window, and a lot of articles on surplus equipment suggest its use as a PA, but I have never actually seen one in use!

>daveb
==========
When I recently had to re-tune a 70 cm preamp after replacing the RF device with one of a different kind, I rigged up a noise generator using a common 1N4005 silicon power diode. It obviously worked well enough for tune up purposes- I was getting adequate noise in the receiver, but I was having trouble switching the generator's drive voltage on and off manually while simultaneously trying to make the preamp adjustments.

I was using a 500 ohm limiting resistance in the diode's circuit, so I knew the current requirement was very low. It occurred to me that maybe the output of my old HP 202A low-frequency function generator could drive the thing to get a pulsing noise output. I hooked it up using square wave output, and set the frequency to about 4 HZ (in other words, the HP 202A was acting as a power supply pulsed at 4 Hz).

What I heard coming from the receiver sounded like a "CHOO-CHOO" locomotive in the distance. Varying the generator's output level gave me control over the noise level, and I was quickly able to do the several iterative adjustments required in the preamp, lower the noise generator drive level, and repeat.

I was surprised at how well the "CHOO-CHOO" audio effect worked. It was very easy for my ear to hear the difference between the artificial noise and the background noise and maximize the difference, while ignoring the absolute levels.

Supplying a similar noise generator from a simple 555 oscillator targeted at 4 HZ would work as well, I expect.

I am considering purchasing a kit for a 2m transceiver and/or 70cm transceiver.
Before I buy anything, I would like to hear any comments and experiences
with various kits. If I get more than a few responses, I will post the
results.

*What kit did you buy (manuf./model #)?

*Was there adequate documentation (schematic, block diag., parts layout,
theory of operation, etc.)?

*How was the PCB (single-sided, multi-layer, silk screen labeling)?

*Overall rating of your kit (1-10, poor to great)

*Where can I get more info on your kit?

*Any other comments?

Thank you for your time and comments

Well--
I was there. There were a few isolated outages for a short period, and some
delayed dial tones (People calling each other to ask "What was that?!". I turned
on my monitor--it was actually relatively quiet.

I'm really glad hams are available to help. They perform extremely valuable
services during emergencies. This one was more in the nature of one hell
of a wake-up call rather than a catastrophe (except for a small number of
folks who did have serious damage).

I thought the account was a bit overblown under the circumstances.

I second the motion. HAMS have always performed valuable services
during emergencies.

One the most key elements of recovery from almost any disaster is
communications. The HAMs perform a service like that of small
independent businesses and agencies do in our market driven economy when
the big government agencies fall flat on their behinds.

2926. Re: DTMF Decoder ???

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-06 00:00:00 UTC
From: kj4uo@aol.com
Message-ID: <4mm97c$8l0@newsbf02.news.aol.com>
Source record: 105554

The best DTMF decoder I have seen yet was one designed by PDRUNEN@AOL.COM.
I
built his design and used his program with no problem at all. I used it
to
monitor the telephone calls going over my repeater. There as a fellow
that
was using my machine to make long-distance phone calls. Shame! Shame!
cost
me about 20 bucks before I could catch him. Turned out he did not have a
ham
ticket too!

Anyway, The program can be loaded off the internet via FTP, to get there
ftp
to

ftp.users.aol.com
login as "ftp"
password "Your e-mail Address"
then cd /pdrunen
then cd /DTMF "use the upper caps"
then get dtmf_v11.exe

Run dtmf_v11 and it will unpack into five files, dtmf_v11.exe, dtmf_1.gif,
dtmf_2.gif, parts.txt and schemat.txt. You will also need a GIF viewer to
view the schematics, there is a good viewer call vugraf13.zip also located
at
this ftp site. I also believe PDRUNEN will sent it to you over the
internet
if you e-mail him at PDRUNEN@aol.com.

Hopes this help, also check this months issue of Nuts and Bolts.

> H
> H

Ah, there is a "minor" problem here... the quad *loop* is inherently a balanced confriguration, whereas coax is unbalanced...

The "usual" solution is to wind a 4:1 balun on a toroid core... plans in ARRL Handbook or Antenna Handbook, among many other sources, so I shan't bore you with winding details... it isn't rocket science, and you CAN wind your own successfully with minimum effort.

Why 4:1??? Because the impedance of the loop is (theoretically) in excess of 200 ohms, so a 4:1 balun presents a good match to 50/52 ohm coax... and, your quad should play very nicely with the balanced feed connected more or less as shown above. I am merely suggesting a balun to make it work better than just attaching the sheild to one side and the center to the other...

Thankyou for your reply,

What I was trying to do here is to measure the bit error rate of the
radio link.
Unfortunately, bring the TNC to KISS mode and thus removing AX.25 does
not
help because there is yet the HDLC layer embedded in the TNC. Can you
give me
some suggestions ?

What about the modem disconnect ? What is that all about ? Frankly, I am
an
absolute newbie to the radio world...

Thanks

Alex

>My advice is to use the oil.

>73,
>Jack WB3U

The PREFERED CHOICE is TRANSFORMER OIL - available (if you are LUCKY) from the "SHOP" or mainatinence dept of the power company. It used to be a controled substance since it contained PCB's and you had to sign for it... knowing the shop formeman or explaining you needed it for AMATUER RADIO/EMERGENCY services would help. Mineral Oil will be the cheapest alternative. IF you follow the recommended FILL LEVEL, you shouldn't have a problem with leakage.... unless you store it upside down.... ? ? ?

2937. Practical to build HF linear?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-07 00:00:00 UTC
From: arlan@worldnet.att.net
Message-ID: <4mmf9r$4mf@mtinsc01-mgt.ops.worldnet.att.net>
Source record: 105561

Howdy,

I'm a newbie to this group...have been reading the traffic for about a month now, and am looking for info regarding the practicallity of homebrewing an HF linear amplfier.

Would prefer something of the solid state ilk (400-500 watts), and would like to power it in the shack using a marine battery. Ameritron, SGC, and Ten-Tec make boxes that seem to fit the bill but I have no desire to dump $800+ for a commercially made device that I would use only occasionally.

Besides, it's been at least 20 years since I was thrown across a room after inadvertently discharging the capacitor of a dissected strobe flash, and have gotten somewhat nostalgic regarding endangering my life with high voltage (grin).

Is it practical to "roll your own" solid state linear? Saw some plans based on Motorola "experimenter" sheets last year at Dayton, but they all required higher DC feeds than a single Marine cell could deliver.

All advice, pointers, tips, tricks, and/or snide comments cheerfully accepted.

Hi,
Has anybody tried building the receiver in the book
Shortwave Superhet Receiver Construction by R A Penfold?

If you have, is it any good? How well does it work?
Have you any comments?

Please E-mail me.

Thanks!

2939. Re: Practical to build HF linear?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-07 00:00:00 UTC
From: Jim <jstrohm@texas.net>
Message-ID: <4mnhok$u82@newsgate.sps.mot.com>
Source record: 105563

While not trivial, it's pretty simple to build a solid-state amp in the range you describe. Start looking at http://mot.com (or do a web search on "motorola" to locate all the places where Motorola has web pages).

Motorola has published a number of application notes along these lines. Some have been reprinted in QST and QEX, and at least one has briefly appeared in the ARRL Handbook. The old Motorola RF Data Book (pink, white, and blue cover) has an extensive treatment of this subject and IMHO is superior to the newer book -- but lacks info on the RF MOSFETS. So you really need both books.

Communications Concepts sells "kits" (within FCC limits) for a number of the Motorola app notes. This is the easiest way, but following one of the app notes I home-brewed a 150-watt HF amp out of the junk box, except for transistors. Expect to spend 15 to 25 cents per watt for bipolar transistors, and maybe twice that for MOSFETs.

For a 500-watt output amp running on 13.8 VDC, you'll need some pretty hefty power cabling (80 amp max). This is a significant reason for the 28-volt and 50-volt finals. The DC current handling requirements are lower for the hi-volt parts.

In any case, heatsinking is a big consideration, and this seems to be the hardest part to locate. For a 500-watt amp at 50% efficiency you'll dissipate as much heat as a big steam iron or small electric stove burner. Keep in mind that your circuit board need not be flat as long as the RF lines are short and symmetrical. You can also use copper bars as heat spreaders to a TO-3 style heatsink with fins on the sides, if you use the flange-mount transistors.

It's somewhat impractical to dunk your heatsink in an ice bath, but I've done it. I've considered a cold plate heatsink but never built one. Peltier junctions won't dissipate enough heat.

Filter your output.

Good luck
Jim N6OTQ

>(3rd overtone, series or parallel cut, loading capactiance... ?)
>
>Thanks again..Hugh..
>
The TRC-505 is similar to the 509 except they have changed styles on the
case and it was a 505 that I converted.
I got my crystals from Jan down in Ft. Meyers and the transmit is a 3rd
overtone loading cap I believe was for 30 pf temp was 25 C and I cannot
tell from the package of specs delivered if it is series or parallel cut.
They are listed under a cb type of crystal (I dont know if that is for
pricing) but if you tell them what you are using the crystal for they
should have specs since mine worked rather well out of the package.
Be sure to get wire leads and keep em long on the transmitter crystal,
you will have to lay it on it's side to keep it from hitting the speaker

and preventing you from closing the case. Also you might want to wrap the crystal in electical tape so it wont short out the components it will have to lay over on. The 505 uses a shorter style crystal but the 509's use a HC18 and lay it over.
Hopes this sheds some light.

2943. RF filter needed

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-07 00:00:00 UTC
From: Larry West <ljw@interactive.net>
Message-ID: <318F8210.32FF@interactive.net>
Source record: 105567

I know this isn't really in the realm of Amateur Radio, but
I thought my fellow Hams would be a good reference point.

I need to block out a very strong local FM Broadcast station
so I can receive a distant station on an adjacent channel.
The receivers I have are not sufficiently selective to
ignore the unwanted signal (or that signal is splattering
everywhere!).

The station I want is on 92.5Mhz, and the station I don't
want is on 92.3Mhz.

I suppose a high-pass filter would be good, as long as I
could switch it in or out of the line. But, I was thinking a
notch filter would be better, as I wouldn't need to switch
it in or out.

I'm willing and able to make it myself, but I need some
values for the components, and some suggestions on
recommended types of filters.

I suppose a directional antenna would help, too, so I'll get
out the 'ol Antenna Book, and check out those possibilities,
too.

You could use a remote switch to select only one loop at a time.

The experience of many people, including myself, is that tying
the loops together makes the antenna tougher to feed, compared
with running separate feedlines.

I've not seen someone come up with the type of answer you are
looking for--the solution is well worth publishing if you find it.

The directional antenna is a good approach... but remember that you don't want maximum _gain_ on the weak station, you want maximum _attenuation_ on the undesired one; even a lowly dipole has null of theoretically infinite depth, and if you could aim that right at the loud station, and it stayed still, you'd be done.

More complicated and more versatile, or at least more adjustable, is to have two different antennas which receive the two stations at different relative strengths with respect to one another, for example a whip (which receives both about equally) and a small beam pointed at one or the other. Now pass one through a variable phase and amplitude shifter, and then combine the two signals with a transformer. With the correct knob settings, the two inputs will contain undesired signals exactly out out of phase and exactly equal amplitude, and so will be perfectly nulled out, while the other signal, being differently represented in the two incoming signals, will _not_ cancel.

Adjusting the amplitudes is easy - something like a small, one-turn pot or variable gain preamp would do. Adjusting the phase might be accomplished with an LC phase shift network, or whatnot, but at 92 MHz - it might just be easier to move one of the antennas. With a wavelength of about three meters, you only have to move them that far to go through the whole 360 degrees.

This might be easier than a filter to make, but unlike the filter, when a plane flies overhead the received phases will get screwed up and the cancellation won't be perfect anymore; Filters are immune to this.

There have been few articles on solid state amps (2 I know of in QST
have been for 1000W versions. You might copy the diagram of a
Ten-Tec or Ameritron or maybe you should buy a kit. One person that
advertises in several journals is Lee KD4YBC. For an SASE you get his
catalog which includes a 500W kit for $250 and a KW model for $500.
There are several others that I list in my book "The Amateur Radio
Mail Order Catalog and Resource Directory". The book is ARRL
publication 5242 available from dealers and ARRL.

The key is to build these amps to run on higher voltage than 13.8V.
Lucas Mfg makes a set of PS at 24, 28, 50V at high amps. Look at the
supply Ameritron uses for their 600W base amp.

Good luck.

Dave K4JRB

2955. Etching piezo-ceramic with saltwater? Homebrew SAW filters

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-08 00:00:00 UTC
From: stephnss@pyrotechnics.com
Message-ID: <4mna5l$5n3@news.pyrotechnics.com>
Source record: 105483
Cross-posted to: sci.materials.ceramics,rec.radio.amateur.homebrew,sci.electronics.components

I am looking for a cheap available etchant for PZT ceramics, the type used in piezoelectric buzzers and transducers, and to understand thier chemistry better.

I found that electropolishing a brass-backed piezo-disk in salt water etched the crystal as well as the brass while etching in a copper sulfate solution does not.

To etch, I tried both bleach (sodium hypochlorite) and hydrochloric acid seperately, with no result. When both were mixed (resulting in chloric acid +ClO^3?) a white precipitate (what?) formed on the dissolving ceramic. I assume this to be the mechanism in electrolyzing saltwater.

Any explanations and/or ways to etch piezo disks to custom shapes for hacker saw-filters?

sometimes a toroid in the same freq range.

There are two spreadsheets on my FTP site that might be of help
if you have Excel 4.0 for Windows or something compatible. The
files are labeled Toroid.xls and Flux2.xls. The FTP site is:
ftp.microserve.com/popaccts/h/jackl/

You can also get the formula from the Amidon flyer (catalog).
Their phone number is: (714) 850-4660. Note that the formula uses
only three factors in determining flux: the cross-sectional area
of the core, the number of turns, and the voltage across the turns.
The maximum permissable flux varies by frequency but not by the
core material. It is inversely proportional to the number of turns
though, so permeability affects the results because it will determine
the number of turns for a given inductance.

It might be a bit difficult building an LC filter for the above
situation. The Q of the filter would have to be on the order of 460.
Plus, the skirts of the filters would have to be rather steep calling
for a multi-section design which equates to having an even higher Q
for the filter sections. If you want to have fun, you can make a
tuned cavity out of 3 pound coffee cans. A little funky, a bit lossy,
but educational.

Better that you try a directional antenna like a simple Yagi. If you
live in an area with tall buildings or mountains, then a directional
antenna may be useless due to reflections.

Seems to me that varactor TV tuners get about a 2 to 1 range. I built
a sweep oscillator using one and covered 50 to 950 MHz in 4 ranges.

I sure hope you were doing this under well ventilated conditions.
Did you see a greenish-yellow gas coming off the solution. You did?
That gas is chlorine. It permanently binds with the oxygen receptor
sites in haemoglobin, just like carbon-monoxide does.

Perhaps chlorine is mostly evolved when bleach is mixed with oxidizing
acids (I've used it with sulphuric to make chlorine). My guess is the
white precipitate is sodium chloride, but please don't taste it. If
you really need to know, take it into a commercial analysis lab. It
may cost you a bit of money, but they will analyse it safely.

>================== THIS TOO, SHALL PASS ==================

Depending on the spacing of the elements, the input impedance can vary from
less than 50 ohms to close to what the full wave loop would be without the
parasitic elements (80-100 ohms). Of course, it is a balanced antenna, so a
balun may be helpful. The assumption that is being made when all the driven
elements are connected together is that only the element resonant for the
band you are on has an impedance close to desired (in the case with the 2:1
transformer, 100 ohms), and that the impedance of the other elements are
significantly higher. This is not a good assumption, and I agree that it
would be better to switch elements. I think you are going to have to test
each element individually to find out if the 2:1 balun helps, though. The
impedance will be influenced by the parasitic element spacing as well as the
fact that the other driven elements are closely coupled to the active one.

Another approach would be to use a single driven element which is resonant on
all the bands of the antenna. For example, a system of traps and wire
elements could be used to adjust the total length of the loop for each
frequency.

2963. Nail polish as coil dope??

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-08 00:00:00 UTC
From: ylshih@alumnae.caltech.edu
Message-ID: <4mqqic$841@gap.cco.caltech.edu>
Source record: 105491

Quick question -

Is clear nail polish (apparently composed of two kinds of acetate and solvent) acceptable as coil dope? I'm building a project and thought I had read somewhere that it was so I used some on four coils. I checked the inductances and they measured the same before and after, but I wasn't able to check for possible Q degrading effects. After I soldered the coils in, I got some real Q-dope. Now I'm wondering if I should pull those coils and rebuild them. Any comments?

You might look into the National LM1881 sync sepparator. Elantec
also makes lots of interesting processing ICs including a Genlock
unit. Try their web pages at http://www.natsemi.com or
http://www.elantec.com

Also, you might save yourself some money by finding a surplus
video mixer/effects unit. I bought one at a local ham flea market
for less than $100. It has 10 inputs and a very good effects bus
for wipes, fades and even chroma key. Companion genlockable sync
generators usually go for about $20 at the same flea market.
I have lots of fun with it on Ham Television (ATV).

Feel free to contact me via Email if you have any other questions.

> Arlan KG8OWHello Arlan,

If you want an HF amplifier, find a used Heath SB-220. You can find
one for about 400-500 dollars; they are worth it! I recently saw one,
brand new, UNUSED for asking price of $600. Worth it! They are 2KW,
built in power supply, pi net output, etc etc. The 3-500Z's will last a
lifetime with care. Avoid homebrewing high power with solid state
designs. There is too much involved for a one-off project, and you won't
save any money when it is all done (and you just might blow up several
expensive devices in the process). Also, the SB-220 or similar will be
worth the same (or more!) when and if you ever want to sell it.
Lastly, they are easy to work on, easily modified to do whatever you
want, fully documented, and REPAIRABLE.

Just some advice from an OT like myself.

73 and GL,

Don, W6JL

2966. Re: 4-1000A

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-08 00:00:00 UTC
From: don.phelps@infoway.com
Message-ID: <9605091141353022@infoway.com>
Source record: 105494

From my efforts with the 4-1000A, I concluded the easiest way
to improve gain and reduce drive requirements was to operate at
the max. rated plate voltage. (grounded grids configuration)
So I adjust for exactly 6000 volts on the plate.

I did this with a large variac on one leg of the 230 volt line.
Switching the other connection of the plate transformer between common and
the other 230 volt line, for a low and high range of plate voltage
(ie 0- 6000; 5000-10,000 volts). In providing the lowest
effectvie line impedance as possible for the best line regulation,
is it better to place a variac arross the whole 230 volt line,
or just one leg of the line? The variac seems to be rated at about
50 Amps, but the load is only for a full legal limit amp.

I seem to recall there is a special tube socket made for use with
a screen grid power supply, but they are expensive, and I did not find
a source on the used ham market. Hence I never purchased them,
and can not attest to how much they improve the tetrode neutralization
problem.

Have others actually used these "tetrode" sockets?

Rebuilding those coils would be a major waste of time. Fingernail
polish work just fine for this. Its only drawback is that it may not
adhere as well as an actual adhesive, and it tends to be brittle. If
you used enough so that it soaked into the coil, between the turns,
neither of these characteristics is likely to cause a problem.

2968. Looking for IC that does PL tone decoding

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-09 00:00:00 UTC
From: god@netaxs.com
Message-ID: <4ms308$3cl@netaxs.com>
Source record: 105496

I'm in the process of designing a unit that hopefully will be able to decode DTMF as well as recognize PL tones. Building the DTMF half shouldn't be a problem, but I'm pretty new at this, and need a recommendation on a chip to do the PL tone decoding. Can I just use a standard tone decoder chip (not DTMF)? Also, will there be any problems with taking the speaker out of a scanner or HT and routing that into the unit? Will the tones be to low? (Is subaudible carried over the speaker out?)

Thanks
-Bill

2969. QY4-250 valves any good?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-09 00:00:00 UTC
From: wk@frc.niwa.cri.nz
Message-ID: <4msest$j70@clam.niwa.cri.nz>
Source record: 105497

I have recently scored a dozen obsolete valves labelled:

"CV2131
QY4-250"

They are ex-spares for a ship based echo sounder. I was wondering if they could be pressed into service on our HF bands. Our contest group at ZM2K is always hard up for amplifiers... Any pointers towards specs (4kV, 250W anode ??) , manufacturer, best (if any) configuration for amateur use etc. etc appreciated.

Wilbert, ZL2BSJ.

Source record: 105500

Are those five-pin base, glass envelope valves?

If so, it's likely to be the 4-250, a tetrode that is good
to 100MHz+ and is a lower-powered version for the 4-400.
The 250 watt dissipation spec you guessed is correct, but
the anode voltage may be high. (the 4- indicates a tetrode).
Should be a 5V filament, ~15 amps.

If operated in grounded-grid, these are a plug-in replacement for
the 4-400. The ARRL Handbook lists these in the tube charts in the
back, with parameters. EIMAC may provide their specs on request.

A grounded-grid 4-400 amp appeared in the ARRL Handbook for several
years in the 1980s, and is the easiest starting point for an amp
made from these valves. They used 3KV anode and -8.1V cathode bias,
if I recall, on a pi-network output. Now-SK K5IQ ran one of these
style amps into a small tri-band beam on the 14.313 Maritime Mobile Net
in the mid-1980s and was very loud throughout most of the western
hemisphere. I would start with that design.

You're invited to a free technical presentation sponsored by the Colorado QRP Club and the Northern California QRP Club (NorCal) Thursday evening, May 16, from 7:00 to 10:00+ p.m. at Days Inn South in Dayton, Ohio. The topic is QRP Rigs - Circuit Analysis and will be presented by Paul Harden, NA5N, the author of the new book, Electronic Data Book for Homebrewers and QRPers including QRP Yellow Pages. Paul is the most sought-after author in the fast-growing QRP area at this time. A Q&A session will follow the presentation.

If you are coming to the Dayton Hamvention, begin the wild weekend Thursday evening at Days Inn South. We will meet in the Miamisburg Room at 7:00 and the presentation will begin at 7:30 p.m.

Days Inn South is located at 3555 Miamisburg-Centerville Road at I-75 and Exit 44 in Dayton.

If you have any questions, I can be reached until Sunday, May 12, 1200Z at CQC@aol.com or via packet at w0hep@kt0h.#neco.co.usa.noam.

CU in Dayton at the Colorado QRP Club table in space 3405.

The 8051 (and other single chip /cpu/eproms) are good for CW iders for
repeaters(especially for my mobile 2Mtr/70Cm crossband) or beacons.
The Cmos version is real good for my 6Mtr (solar pwrd beacon) The current
drain is next to nothing. For repeater iders, it is fun to get the ider
to id on power up, the first time the tx comes up after 7min or so, then
to force an id cycle after 10 minutes (if there was no transmission after
7min). Sometimes simple is simply better.

2976. "Blue Steel Razor" radio?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-09 00:00:00 UTC
From: rjg@itasca.stat.umn.edu
Message-ID: <4mt9mo$q5b@epx.cis.umn.edu>
Source record: 105504

OK. Dunno if this is the right place to start, but in any case, would appreciate email as I tend to blow past a lot of news on the daily lack of time. :-(

In doing some WWII POW research I ran across some mention of very simple shortwave or AM receivers that were being built in the barracks using (mostly) accessible materials... Kindof a crude crystal set without the crystal, centered, I guess, on a blue steel razor and a pencil lead.

Haven't thought about it for a while until it came up in discussion elsewhere which timed perfectly with a museum display being discussed about POWs during WWII for this summer.

I'm trying to track down information on these "homebuilt" radios and, if lucky, find a plan to actually construct an operational one to add into the display.

It's kindof the other end of the scale from what traditional radios are today, but hoping someone out there has what I'm looking for... Or can point me in the right direction.

Any info? Please email...
Thanks,

/bob

Jackson Bros., here in the UK, still make them. They are rather
expensive.

Jack wanted me to point out that the flux values
he mentions aren't related to saturation--that they
are Amidon's estimates for RF operation.

OTOH, I don't see how flux values can accurately predict core
losses if it ignores the core material.

2983. Re: CB vs Marine VHF for mountain lakes

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-09 00:00:00 UTC
From: Jim Devenport <jdevenport@lanl.gov>
Message-ID: <319259A2.7893@lanl.gov>
Source record: 105511

My experience in this area is that there is little, if any, "bending" at
any frequency above say 1.8 MHZ. Radio waves travel mostly in straight
lines except in the case of high or VHF signals which tend to "bounce"
off small objects, rocks, metal billboards, rugged mountains and ridges,
etc. My experience is that VHF works much better than HF 80 thru
6 meters through canyons and other rugged terrain that you describe
because of both the lower background noise at VHF and the bounces
provided by the so-called obstructions.
I've never operated over open water between vessels etc. but the stories
I've heard from boating CB'ers is that the range is much greater at 27
MHZ over water than over land.
Why not try both and report back to the "world" what your experience is?

Flux calculations aren't as useful at HF, since the iron
powder cores are typically limited by power dissipation,
as opposed to core saturation. Ferrites are rarely useful
in a high power tuned circut due to their poor temperature
stability. I'd measure the Q can calculate the temperature
rise. The flux formula is useful when designing a 50 kHz
switcher.

I use a 1:1 balun for each loop (Bencher, but any brand is OK).
Where needed I used a coax matching section to match.
On 20mtr, my 3 el on 26' boom was 49 ohms so no matching was needed for
50 ohm coax.
Ditto for 5 el on 15 mtrs with same boom.
10 meters, 5 elements came out to near 90 ohms impedence and I used a
section of 75 ohm coax between the balun and the 50 ohm feedline.
Each element is fed seperately through a switchbox.
I have used a variety of other feed methods in the past, such as gamma
matching (cumbersome) and found that the simple balun approach works
great and is mechanically the most simple.

A marine radio with 25 w. output into a 3 db antenna, on each boat, should completely cover the area you are interested in. 150 MHz signals should bounce quite well off any canyons that might create a loss of sight situation, especially with the 50 w.ERP at 15 feet (or so) above the waterline.
However, there may be a legality question, as to whether the VHF Marine band is available for use in the location in question.

Chris,

If you got a lot of complaints from *different* folks that's one
thing. If you got a lot from *one* guy, anonymously yet(!), forget
it.

Your L.O.S.A. was well done and well organized. I for one would like
to see it continue. Thanks for your efforts.

Have another read of Cubical Quads. What you actually end up
doing is producing a multiple gamma match, one for each loop.
Of course they interact to all heck while being adjusted.I
seem to recall that the preferred order of adjustment was
from smallest loop to largest loop for minimum interaction -
BUT I COULD BE TOTALLY WRONG ON THIS.

Another source of information is a series of articles
published in the Wireless Institute of Australia magazine
"Amateur Radio" about 15 +/- 5 years ago on multiband quads
which had several column inches on the care and feeding of
these gamma matches.

Hope this helps!

Thanks, Zack; this is a great help. I've been worrying about saturation (as I thought that would mean IMD) for a long time, and the formulas and theory are way beyond me. I've probably cluttered up my gear with toroids larger than necessary just to be safe.

Does this mean I can use any size powdered iron core toroid I want at any frequency, so long as it doesn't get too hot to touch?

For example, I used three T50-10 in a LPF at the output of a 2 watt 50 Mc transverter. But maybe I could have used T37-10 or even T25-10? (I suppose the latter would mean smaller wire, and more loss, but I don't usually care about loss at that power level.) When I get to 144 Mc I go to air wound.

Yes, and I also believe--in the laws of statistics and the criminal code. (At least if I can get caught.)

Look at http://www.usps.gov/websites/depart/inspect/chainlet.htm

Suppose one person makes $15K. Well, then they have gotten the equivalent of all of the entry fees of 3K people.

So, there must be 3K people getting $15K. So, they must have gotten the equivalent of the entry fees of 9 million people.

So, there must be 9 million people getting $15K. So, they must have gotten the equivalent of the entry fees of 27 billion people. Earth has 5.7 billion people.

In other words, this is a fucking fraud!

Source record: 105519

The Amidon data manual suggests values of flux *density* at various frequencies to prevent overheating. Graphical info is also given. If the flux density is limited to the values that they suggest, the number of turns and the maximum applied voltage at a certain frequency can then be calculated, using a formula derived from Faraday's law. These "guidelines" are the *same* for iron and ferrite cores. The flux density levels suggested are far below the saturation level and are based on a combination of hysteresis, eddy current and dielectric losses per unit volume, all of which increase rapidly with frequency. Saturation is not the criterion for these suggested values of flux density, which for iron is about 5000 Gauss and for ferrite about 2000 Gauss.

A further consideration is the value of inductive reactance at the lowest frequency of interest. For a given core this determines the number of turns. For a high permeability ferrite the required minimum number of turns is very small and for a given value of applied voltage this can cause the flux density to become too large and exceed the guidelines. If we increase the number of turns the inductance becomes much much larger, perhaps too large, and the Q can deteriorate, especially at the *high* end of the frequency range. So for high power, broadband RF transformer applications the larger, low permeability iron core or a low permeability ferrite would be desirable.

For transmatch baluns the large iron core, or perhaps multiple stacked cores, with a mu of 10 or 15 and many turns, seems to be the favorite, perhaps also because of its higher saturation level (less intermodulation distortion). This transformer will withstand fairly high voltages if it is used within the suggested Amidon guidelines at the various frequencies. If the core gets too warm (voltage too high), reduce the voltage level, either by reducing the impedance level or the power level.

Further info is in an article in QEX for May 1995, which was written in consultation with an Amidon engineer.

>Those who would sacrifice liberty for security deserve neither. -Ben Franklin
Boy does this take me back. In the third grade, about 1960, a friend had
an old Boys Life (the Boy Scouts of America Magazine). There was a
artical on a crystal-less radio. It used a blued razor blade as the
detector. We built two, using broomstick as the coil form, a 50' "long
wire" and split a WWII headset. The head set had a pair of magnetic
"cans", and I think they were about 2000ohms. Later dad order a crystal
earphone (from Burnstien And Applebe <spelling?>). The crystal earphone
worked much better than the magnetic earphone.
I think the the blue blades where "blued" with selenium. And that is how
the detector worked. We use Gillette (again spelling) blades, but I have
not seen any "stand alone" razor blades in years (or really decades).
I still have the crystal earpiece, and have built a crystal radio(with

a torroid and using a "hot carrier" diode as the detector) But, I have often thought of the old blue razor blade radio. My wife and a few friends thought me "kind of touched" when I mentioned this method of detection. You can also build a liquid detector, but I have forgotten the chemicals/electrodes that we used. We use a bent saftey pin not a pencil. I suspect that during WWI(the period that they did this, I think) they used read lead. But I am not sure.
Good luck

2994. Re: "Blue Steel Razor" radio?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-10 00:00:00 UTC
From: "Tom V. Pfaffenbach" <tvpfaffe@mail.delcoelect.com>
Message-ID: <4mvgus$ovl@kocrsv08.delcoelect.com>
Source record: 105521

The razor blade and pencil lead (graphite) detector is a form of diode rectifier discovered in very early electrical experiments of resistance and conduction with alternating currents.

A semiconducting junction is formed between the iron doped with carbon to form the steel blade and the pure carbon of the graphite lead. In the early days of radio the "Coherer" detector was formed of iron filings between carbon buttons in a glass tube. Folks would shake the tube to obtain the best "Point-Contact" diode that they could get.

The circuit functions as any other diode detector. Any text on radio should have a functional description of how a rectifier is used to detect and de-modulate an amplitude modulated radio carrier wave.

If you want to "construct" one, go to Radio Shack, buy their crystal radio set, and after you have it set up and running, replace the crystal diode, with the pencil lead and razor blade. Connection to the lead is facilitated if you have an old Eversharp metal mechanical pencil or an old metal drafting lead holder!

Have fun and don't cut yourself!!

From: bob@waterw.com
Message-ID: <4n00rj$ei3@sea.waterw.com>
Source record: 105523

I've been thinking about buying a good scope for my workbench.
Being a software person, I have never used one "professionally,"
so I don't know the various features/models available. Because
of previous experiences, a Tektronics would be prefered, but
what are the advantages/problems of various models?

My basic requirements:

* Dual trace
* 20 MHz
* Not overly expensive, like under $400.
* Mainframe design seems nice since new features could
be added later (one I figure out what they do).
* Smaller size is prefered; a cart is definately out.

So, what are all these models? I see lots of 561A, 7403N, etc.
What's a decent type?

Bob

1.4 List of contributions.
1.5 Credits and other things.

_____________________________________________

1.0 What is BASIC Stamp ?
-------------------------

This is being written for people who have no idea of what a BASIC
Stamp is...

BASIC Stamps are small reprogrammable single board computers (SBC)
that run BASIC programs and are made by Parallax, Inc. in US. At
first glance, they may seem fairly minimal - and in fact, they are.
But with software that fully utilizes all available hardware, the
Stamps give you powerful features - without the cost of hardware.

Their low cost and simplicity make the Stamps perfect for many
prototyping and control applications. It's suitable for electronics
hobbyists as well as electronics professionals in many different
areas.

Typical application areas for BASIC Stamp's are...

- General electronics
- Home automation
- Robotics
- Mini PLC
- Education
- Prototyping
- HAM related applications
- Special effects in films
```

- Industri control
- Geological instruments
- Computer peripherals
- Scale model hobbyists
- Model train hobbyists

As an talent engineer and technical writer expressed it...

- BASIC Stamp is the 555 of the 90's !

1.1 What is L.O.S.A all about ?

I started to compile L.O.S.A because I know there are lots of great ideas and many problems that are solved with the BASIC Stamp and the main purpose of this list is to get an idea of what other people are using their BASIC Stamps for and maybe get some inspiration or hints.

Remember it's up to all of us if this list are going to be any good and I'm looking forward to receive a description of your application.

1.2 How can I contribute to this list ?

If you have done something with the BASIC Stamp (big or small) that you are willing to tell others please use the form given below and write a short description, nothing fancy is needed just a simple explanation. If you have source code to share that's even better but it's not necessary.

Then e-mail the form to:

cj@hth.com

With the following as the subject:

L.O.S.A Contribution

Or you could point your Web-browser to the following URL and fill in the L.O.S.A form on the Web-page...

Title : Robo-Cat [# 001]
==========
Date : 950807
Author: Gustavson Guy W.
E-mail: GWGUSTAVSO@mpg.norstan.com

Stamp model : BASIC Stamp Rev. D
Code available: N/A
Filename : N/A
URL : http://www.winternet.com/~bigfoot/cat.html

Description :

My cat, Kesha, was recently diagnosed with Heptic Lipodosis. Or
"Fatty Liver", basicly what this means is that for some reason he
stoped eating and his liver started converting body to useable
sugars. The fat deposists biuld up in the liver and cause severe
liver damage. Because the liver isn't working well the cat feels
crappy and wants to eat even less. The treatment for this disease is
to run a tube down down the cats nose into his stomach, or a PEG
tube through the abomine wall into the stomach and feed the cat a
liquid diet this way.

I love my cat, but I can't be there every three hours to feed him
through the tube for a month. Something about work and deadlines and

such. So I went to a local supplus house and got a tiny motor driven pump, a case, some switches, a micro switch, ect...

The micro switch is mounted such that the switch trips for every rotation of the pump shaft. The stamp turns on the pump for on a single rotation at intervels programable from the controll switches on top. An alarm buzzer and LED flash if the pump fails to run for any reason. The unit is programable for 9 differents deleviery rates.

Now he gets a slow continuious feeding and he seems to tolerate this better than the 100ml feeding every three hours.

```
=============================================================================
Title : Logic Rudder [# 002]
=============================================================================
Date : 950812
Author: Christer Johansson
E-mail: cj@hth.com
-----------------------------------------------------------------------------
Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : LRUDDER.ZIP
URL : http://www.hth.com/filelibrary/BS1-IC/
-----------------------------------------------------------------------------
Description :
```

Many of the new and very realistic flight sims available today needs rudder to let you get full control. This one uses a digital pot from Xicor (X9104) and 10 other components. Connects to a standard IBM-PC game port and power is taken from the port.

It uses two micro switches for controlling the rudders left or right and to indicate when rudders move there is a red LED that lights up when you press the micro switches and to indicate center there is a green LED. If you press the both micro swithes the rudder will automaticly return to center position.

There is a trim pot to set the desired step rate from slow to very fast and the Xicor pot has 99 steps wich gives a fair resolution.

```
=============================================================================
Title : Interfacing MAX186 8 channel 12bit A/D [# 003]
=============================================================================
Date : 950925
Author: Helmut Fligge
E-mail: h.fligge@asco.nev.sub.de
-----------------------------------------------------------------------------
Stamp model : BS1-IC
Code available: YES
Filename : N/A
URL : N/A
-----------------------------------------------------------------------------
```

Description :

This Program interfaces the Stamp1 to the MAX186 A/D converter. Via RS232 2400bps the stamp is asked to measure channel numbern. After conversion the result will be returned to the host computer as an ascii string (0 .. 4096). Conversion rate is about 4 measures per second.

==========

Title : Scrolling LED Sign [# 004]

==========

Date : 950926
Author: Bob Blick
E-mail: Bob_Blick@redwoodfn.org

Stamp model : BASIC Stamp Rev. D
Code available: Maybe sometime
Filename : N/A
URL : http://www.execpc.com/~bblick/stamp.html

Description :

Scrolling LED sign, 35 super-bright LEDs in a 5-by-7 matrix in the prototyping area of a Basic Stamp rev D. A scrolling alphanumeric message moves one pixel at a time, just like real scrolling LED signs, except this one only displays one full letter or portion of two letters at a time as the message moves by.

==========

Title : Tone Decoder [# 005]

==========

Date : 950926
Author: Bob Blick
E-mail: Bob_Blick@redwoodfn.org

Stamp model : BASIC Stamp Rev. D
Code available: Soon
Filename : N/A
URL : http://www.execpc.com/~bblick/stamp.html

Description :

Listens for telephone touchtones, displays phone numbers on LCD screen and echos them out RS-232 port. Circuitry fits in prototyping area of rev D Basic Stamp:

Microphone preamplifier, touchtone decoder IC.

==========

Title : Pager [# 006]

==========

Date : 950928

Author: Don McKenzie
E-mail: donmck@labyrinth.net.au

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : PAGER.BAS
URL : http://www.labyrinth.net.au/~donmck

Description :

This program for the Basic Stamp is used to monitor 4 hardware signals. If a change takes place, (after testing for a false trigger) then a cheap 2400 baud MODEM is used to dial into a Telecom Alpha-Numeric pager. It leaves a message which consists of a 2 digit I.D. (01 to 99) followed by the 4 signal levels of pins 3 to 0.

Status of the signal levels message: 0=Low, 1=High. EG: "011110" means Unit "01" has pins 3, 2, and 1 high, and pin 0 is low.

A "Ring-In" feature is also included. By ringing the MODEM for a short period, then hanging up, the Stamp will dial your Pager and report the current hardware status of these four signals.

This program uses about half of the available memory, so if the user wishes to add enchancements such as "Multiple Ring-In's" say within a minute, for a command selection, there is plenty of program space left.

==========
Title : HexWalker Mobile Robot [# 007]
==========
Date : 950929
Author: T. R. Thornton
E-mail: mandtsys@ix.netcom.com

Stamp model : BASIC Stamp Rev. D or BS1-IC
Code available: YES
Filename : WALK.BAS
URL : N/A

Description :

HexWalker is a six legged mobile robot that is controlled by a BASIC Stamp or BS1-IC, and driven by three servo motors (similar to Futaba S148). It is the simplest walking machine architecture that can walk forward, backward, and turn left or right.

==========
Title : Robo Bug [# 008]
==========
Date : 951003
Author: David Novick

E-mail: dkn@cimar.me.ufl.edu

Stamp model : BS1-IC
Code available: YES
Filename : N/A
URL : http://www.me.ufl.edu/~dkn

Description :

Using two stamps, a robot with six legs (2 degrees of freedom each) was able to walk and turn (at this stage, not very gracefully).

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : EXPBOT.BAS
URL : E-mail author and he will send it

Description :

This program allows a cool robot to move abound a room in search of light. Like a moth. Simple program changes can dramatically change the robots behavior.

==========
Title : Andrews Ever Evolving Lego Robot [# 010]
==========
Date : 951119
Author: Andrew H. Hochheimer
E-mail: softarts@ciaccess.com

Stamp model : BS2-IC
Code available: YES
Filename : N/A
URL : http://www.wincom.net/~softarts

Description :

Currently the robot can only navigate to the brightest light source in a room. It's current operation mode has four major steps: - Scan a 180 Degree Field of "Vision" taking light level readings, and determining the brightest direction of light. - Decide if it needs to turn left, right, or continue moving forward. - Check for collision with an object while moving, if a collision occurs, display the total travel distance on the display - Move forward for 1.5 Seconds and then repeat the process.

Currently I am using Two Futaba FP-S128 Servos (any RC Car Servos would work) one to sweep it's "sensors" form left to right, and one to "stear" the robot.

You can see pictures and more information on my homepage, just follow the lego robot link.

==========
Title : Factory Monitoring System [# 011]
==========
Date : 951120
Author: Paul Willemse
E-mail: pjwill@merlion.singnet.com.sg

Stamp model : BASIC Stamp Rev. D
Code available: YES
Filename : N/A
URL : E-mail author

Description :

The system presently consists of 4 Basic Stamp units. Each monitors up to 5 inputs. The inputs are 'digital' (switches) and/or analog (temp, airflow, current, etc using commercial sensors). All stamps communicate the results via serial mode to a Macintosh (Yes a Mac!) where the results are graphically displayed and monitored. Alarms are set for certain conditions.

The transmission is simple, one way only. Each stamp sends the info at a 'random' interval not exceeding 2 seconds. The message format is fixed, the Mac will throw away any conflicts in case two or more stamps transmit at the same time. BTW this happens very seldom. The max time any stamp can be 'absent' from the chain before an alarm is raised is six seconds (failure, transmission collisons, etc). This is controlled by the Mac.

The 'system' is presently in beta test, the client wishes to expand up to 20 stamps. At that point we will likely use the BS1-IC or BS2-IC on custom boards located around the facility.

Code is available upon request (e-mail) partial, some is proprietory to my client.

==========
Title : Wave to the Cats/Desk Temperature [# 012]
==========
Date : 951121
Author: Paul Haas
E-mail: paulh@hamjudo.com

Stamp model : BS1-IC
Code available: Yes
Filename : See web server

URL : http://hogwild.hamjudo.com/cgi-bin/stamp

Description :

The Stamp has a serial connection to web server, a cardboard hand, a servo motor to move the hand, and a DS1620 thermostat chip to measure the temperature. The web server can request the current temperature or start the hand waving. See the web page for the source code for the temp and the web server.

It's mostly useless. The cats ignore the hand. A few people find it entertaining.

==========
Title : Gamer's Die Roller [# 013]
==========
Date : 951122
Author: Larry Tremblay
E-mail: ltremblay@domus.com

Stamp model : BS2-IC
Code available: N/A
Filename : N/A
URL : N/A

Description :

The Gamer's Die roller is a little thing I am putting together as my first Stamp Project. The Roller allows cumulative rolls of n dice up to 256 sides, so long as the sum does not exceed 99,999,999(!)

It uses two 74HC161 4 bit counters cycling at 1MHz to draw random numbers off of. Input is achieved via a Grayhill model 38 keypad and a 74C922 keypad decoder. Display is on a Siemens PDSP-2111 8 character smart display (5x7 LED characters) fed by two 74HC164 serial to parallel shift registers cascaded so I can use Shiftout to feed 16 bits of control + data off of 2 pins.

The code is very simple, the most exotic part being the random number generation. In a nutshell, it is:

Begin Loop
S = 8 bit number drawn from the counter (random)
if S < (255/N) x N (integer divide, N is number of sides on die)
exit Loop
End Loop

This gets (pseudo) random numbers whose average is not skewed downwards by the counter's max of 256 (i.e. a 100 sided die is not affected by the extra 56 in the count maximum)

Using gamer's dice notation, (5d6 = sum of 5 six sided dice, 3d10 = sum of 3 ten sided dice), the user can input whatever combination

they wish, including just 'd6' for one six sider. The keypad I have has removeable keycaps with legends, so I have 0-9 plus 'd' and '=' on them.

As noted earlier, since I am using an 8 bit counter, the maximum die size is 256, although that could be fixed easily by sampling two, three or more times for each die.

Anyhow, that's it. When the code is done and debugged, I'll be happy to e-mail it to any who want it.

Title : Sculpture control [# 025]
==========================================================================
Date : 960323
Author: Pierre Olivier
E-mail: olipie@aei.ca
--------------------------------------------------------------------------
Stamp model : BASIC Stamp Rev. D
Code available: N/A
```

Filename : N/A
URL : N/A

Description :

I have been working with sculptors for some time doing control circuits for their works using 555 (limited), industrial controllers (expensive and hell to program) and lately Basic Stamp.

Our latest piece deals with image deconstruction: it consists of 20 vertical cylinders on which an image is wrapped. Each has a photo detector to detect "position zero", and a custom basic stamp board with a MC3479 step motor driver that drives a step motor which turns one cylinder. Each cylinder can thus have its own routine which positions it precisely (400 steps/rev motors) where we want it for any amount of time, at any speed (very interesting sonically at sub-second stepping speeds!).

The stamp outputs direction, step and enable signals to the motor driver and a ready signal to a common line. It receives signals from the aforementionned ready line, and from the optical sensor.

It would have been quite a bit more complicated, bulkyer and expensive to implement this project without the stamp.

==========
Title : Automotive Lamp Control [# 029]
==========
Date : 960427
Author: Ron Woodward
E-mail: RWoodward@gnn.com

Stamp model : BS2-IC Module
Code available: N/A (Will share concepts)
Filename : N/A
URL : N/A

Description :

This system involved connecting two BS2 units to a bank of 28 MOSFET drivers which controled the external lighting in a demonstration

vehicle shown at the SAE expo in Detroit MI.

The lighting control had to perform PWM modulation simultaniously on 10 different circuits while controling Turn, Stop, Tail, Backup Hi Beam, Low Beam and fog lamp circuits with a set of preprogrammed timing sequences.

The timing was worked out so that the PWM of the lamps was flicker free throughtout the demonstration sequence.

The BS2 units worked together in a master - slave relationship to maintain proper sequencing of lights on both hands of the vehicle.

You're right on target! Highest to lowest frequency.

It takes some juggling.

However, once done, the match stays done.

I've used the gamma match feed system on quads (and virtually everything
else I can reasonably adapt it to. It works on the quads VERY well.

Another tip. In stead of chasing all over heck and back for big variable capacitors as you get down to 40 and 80 meter quads, use a chunk of RG-8 coax cable as a capacitor. It has capacity and a nice hefty dialectric that will let you use the inner conductor as one arm of a capacitor and the outer shield as the other arm. You get it too long by a foot or so for the total capacity you need. You whackem off an inch or so at a time at lower power to trim away the capacitance. You use a much smaller air variable for the trimmer.

When done, presto, BIG heavy cap for 40 and 80 meter versions heap cheapo.

Be sure to trim away some of the braid and leave an inch or so of the inner conductor and insulation extended to avoice arcing at high power....

Tape the end up to excude water.

Smile all the way to the bank.

:)

>
>OTOH, I don't see how flux values can accurately predict core
>losses if it ignores the core material.

Amidon claims that the figures shown in their guidelines for maximum permissable flux "may vary slightly according to material used." If the number of turns is adjusted from one core material to the next so that the inductance of each winding is kept the same, the flux (loss) will indeed be shown to increase with permeability, according to the Amidon formula. This is due to the relationship between inductance and the number of turns.

The following examples illustrate this. Each assumes the core is used to create an inductor with a single winding. The winding is shunted across a 50 ohm circuit operating at a power level of 1 KW at 7 MHz.

CORE u Turns uH Flux

T-200-6 8 25 6.25 22
T-200-2 10 23 6.35 24
FT-240-67 40 11 6.41 42
FT-240-61 125 6 6.23 76
FT-240-43 850 2* 4.96 229

*Nearest whole number producing similar inductance

From this, it can be seen that for a particular inductance, flux increases as the permeability of the core rises. Amidon's guideline for flux at 7 MHz is 57 gauss. Therefore, in this application, only the first three cores would be suitable. If this was a narrowband application, the iron powder cores would be preferable due to their higher Q and more stable temperature characteristics. On the other hand, a broadband transformer application would probably require the FT-240-67 due to its use of fewer turns. The latter results in reduced interwinding capacitance and extended high-frequency response.

>what are the advantages/problems of various models?

Some years ago, I went looking for a 100 MHz scope. HP was not in my price range, but I wanted to buy an American product. Unfortunately, the under-$2,000 line from Tek didn't have horizontal/vertical sync separators for triggering on video, nor was it available as an option. I ended up buying a Japanese brand for about $1,200 that had it as a standard feature.

The proper term to use is flux density, not flux. Amidon suggests 57 Gauss at 7 MHz. Gauss is a flux density term. The flux density is determined by the "volts-per-turn", the core cross section and the frequency, all of which are basically independent of permeability. Note that the path length (diameter) of the core is not mentioned, but a large core has more turns, therefore a smaller volts-per-turn.

The exposed surface area also affects temperatur rise to some extent, and Amidon talks about that also. A large core is better because it dissipates heat better. It is also probably not good to have a transformer "mummified" with lots of tape.

Hi,

>Why are you posting this crap about stamps? It costs me money
>to download news and I can't pick and choose. Who the Hell asked
>you to do this?

Received several of the above e-mail from a person who didn't like
to give his name or e-mail address, he used an anonymous-remailer !

However I would like to hear if others feel the same about L.O.S.A
and if thats the case I will stop posting it.

I understand that not everyone is using the STAMP but I think many
people enjoy reading what could be done and maybe get som hints or
inspiration for applications of their own or am I wrong ?

Regards,

/Christer

```
+------R2-----------------+
| |
| node |\ |
>Audio 1======|---R1- + -+---|-\NE5532 (or 741) |
> | | \________--------+----===INPUT
> | | /
> | +-|+/
>Audio 2======|---R1 ----+ | |/
V (gnd)
```

Gain for each channel is -(r2/r1)
The point labelled "node" is a "virtual ground" and wont let audio leak.
Input impedance is r1.
output impedance is near 0 ohms.
NE5532 is a lo-noise OPAmp (< $0.75 at digikey,
more some places, less others)
741 is standard (noisy) op-amp, very cheap.
both "R1's" do not _have_ to be equal if you would like
different gain for each "audio"
for audio, I would keep the gain below 10. (5 , 2 or 1 work well)

>Can I just add a diode to the audio outputs to prevent the "back-feed"
>or is there something more to it???

No, diode won't work.

I am thinking of building an HF amp. useing a 4cx1600B. The manufacture of the tube recemends grid driving whith a 50 ohm resistor. I have never built a grid driven amp of this type and was woundering if there is someone out there that might be able to give me some feedback on this.

3012. Audio input/output

Brett,
Diodes won't do what you want since audio is basically "fast
a.c." The way I usually do it is a quick and dirty audio mixer using
op-amps. I think Rat Shack has one of their little "Engineering
Notebooks" with the schematic and instructions for it. You can use as
many as you want to make more inputs.

Source record: 105445

Some months ago there was an article either here or in the antenna group about design notes for baluns. It was several pages long and included several test type drawings of balun configurations. In addition, there were many suggestions about winding style, bandwidth and materials. I don't recall the author either.

I thought I printed a copy but now that I need it, I can't find it.

Please email me or post on the group.

Thanks, Ted.

>Audio 2======|
>
>Can I just add a diode to the audio outputs to prevent the "back-feed"
>or is there something more to it???

No, you can't just add a diode. Audio is not DC. A diode would just
halfwave rectify the signals and make them sound like crap.

What you want is called a *mixer*. A classic mixer has variable attenuators
feeding a common buss which is at a very much lower impedance than the inputs
to the attenuators. That low impedance buss is then in turn amplified by
an output amplifier with a very low input impedance and an output impedance
compatible with the device it is to drive. Usually a variation of the
common opamp circuit is used since it offers a "virtual ground" impedance
at its input. This reduces greatly the amount of signal that can flow in
through one attenuator and then back out through another.

If the two input signals are low level, then preamps are usually placed
before the attenuators, and these have sufficient S21 isolation to prevent
any backfeed problems.

Now if the two sources are fairly high power, and you can't afford to
discard that power, you have a problem. The circuit you need then is
called a hybrid combiner, and they are very hard to make work correctly
over a multi-octave range. You should probably rethink the problem at
this point.

If you can afford to discard the power, however, then you can use a
simple *bridging* circuit. In this circuit, you terminate each of the
sources in its design impedance (say 8 ohms for an audio power amplifier),
and then bridge across it with a high impedance (say a 10k ohm resistance).
You can then tie these bridging resistors together to form the combined
signal. That will then be amplified by a high input impedance amplifier
and fed to the third device. Backfeed will be reduced in proportion to
the ratio of the terminating resistance to the bridging resistance, IE
in this case to 8/10,000ths or by -62 db.

The circuit looks roughly like this:

> Good luck

There is a story that has floated around here (Des Moines, Iowa area) that back a number of years ago, a local ham had an interesting experience with razor blade detection. It seems that he had just put his AM Kilowatt transmitter on the air and a neighbor complained about hearing the ham's voice in his toilet. The ham put his wife on the mike, went next door and sure enough, there was a voice coming out of the toilet bowl.

They pulled the stool and found a number of razor blades that had been thrown down the toilet. It would have been funny if the ham had used the old expression "you're splattering old man."

NOPE ... The solvent is acetone, highly flammable and toxic

The thing you could do, however, is looking at your local library for some real olden radio builder's book. I was amazed, how old some of the stuff is, they have at my local library. In those real old books, you might find some recipes for what you need.

> adhere as well as an actual adhesive, and it tends to be brittle.

... cause it is not made for coils, but for fingernails

> you used enough so that it soaked into the coil, between the turns,
> neither of these characteristics is likely to cause a problem.

When you soak it, you might change the dielectricum and -- though unlikely to have much influence --- the coils might change in frequency response ...

3026. HF VFO's with chip capacitors

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-12 00:00:00 UTC
From: rohrwerk@netcom.com
Message-ID: <rohrwerk-1205961646020001@10.0.2.15>
Source record: 105454

I have had only "OK" success in VFO stability with the usual compact toroid (type 6, yellow) approach. A noticeable upward drift seemed unavoidable. A few breadboarded air-core VFO's did very well, but then putting them in a PC board box below a certain size degraded the stability.

On a whim once, I got an NP0 chip capacitor kit from DigiKey -- my surplus NP0 disk ceramics from various sources are often rather large, so I thought I'd try going to the other extreme :-).

An approximation of the "Optimized QRP Transceiver" Hartley VFO, at 7 MHz, with chip caps in the frequency determining stages, is now testing in the shack. The PC board (single sided) is attached directly to the capacitor stator pins, and right now only tack soldered to the box. Even without the toroid doped up and cemented down, I got about 200 Hz warmup drift (downward) for about 10 minutes, then about 40 Hz drift (down) over the next 1-1/2 hours. Better than I have had before! Whether this is attributed to the fact that they're chip caps, or whatever other combination of factors (different varactor diode characteristics, whatever), nice to get stability in this range.

In a stability thread a while back on this group and QRP-L, lots of folks reported different experiences with different circuits. Just thought I'd add more fuel to the flames.

3030. *Really* low noise-figure preamp designs?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-13 00:00:00 UTC
From: tiemann@spot.Colorado.EDU
Message-ID: <4n8f8v$ma7@peabody.colorado.edu>
Source record: 105381

I recall mention of high-power GaAsFETs being used to win the noise-figure contests (held at VHF/UHF get-togethers) with NFs around 0.2-0.25 dB, well below the typical 0.6 dB stated for the GaAsFET preamps in the ARRL Handbook's VHF projects section. Are the former capable of low-IMD in high-signal areas? If so, are there published circuits (and part numbers) for the ultralow noise preamps?

For starters, I'm interested in 6m and 2m.

By chance, does anyone from the W2SZ/1 camp care to shed some light on the high-performance preamps they use (if any)?

I happen to like the L.O.S.A. postings, and I think Basic Stamps (and all the various clones out there now) are a great way to control many smaller/slower projects. I think they are not only usefull, but encourage newcomers to some of these control areas (robotics and the like) to perhaps go further with home grown hardware and software.

But heck...the Stamp itself if VERY usefull in its own right!

> However I would like to hear if others feel the same about L.O.S.A

> inspiration for applications of their own or am I wrong ?
>

Like the "Tony the Tiger" commercial....some find it hard to "admit" that they program in Basic and use Basic Stamps....but ask these same people if they could have done some of these jobs in an easier, less expensive, and quicker manner.....and often the answer is NO.

It is a great building block....its no speed demon, so it isn't for every application.....but then again an 32 Processor Sun SPARC server 2000 is FAST....but I don't think I'd automate my model railroad, or build a line following robot out of it either.

-Quentin

Go to my web page, click on the "Ham radio" icon, and you will find instructions for one of their PL decoders. (I can never find the paper version when I need it so I thought I'd make it handy.) Their address is in there too. I believe it listed the price as around $100, but I have a hard time believing they actually get that kind of money for that tiny little board :-). You can find them at hamfests for $20 or less. Now, I'm not sure what the TS-32 is, mine is a different model; but mine is the one that has dip switches to set the PL, it's a little postage stamp sized board, and has only 3 wires to hook up (power, ground and the output signal).

3041. QRP power AM modulator/transmitter diagram in a.b.pictures.misc

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-13 00:00:00 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseDrBHuK.Iy7@netcom.com>
Source record: 105457
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.broadcast,rec.antiques.radio+phono

I built and drew up a schematic diagram of a simple AM modulator. Basically a class C RF amp modulator. In this particular case, I wanted a "part 15" AM modulator to play old music on old tube AM radios. I used a crystal oscillator module (I had 10MHz handy), and used a 74LS153 counter/divider chip to get a frequency of 1250 KHz (which has no local station around here). I then used an "open collector" gate to "chop" a source of audio, in this case, an emitter follower. This chopping action (as long as the audio doesn't hit the supply rails is equivalent to a Class C RF amp being AM modulated by a variable supply voltage, variating at the audio rate. I made no attempt to remove the harmonics from the RF being a square wave, I figure that the strength of these are too low to much worry about. The main carrier is less than 20 mW anyway. Use a piece of wire about 9 feet long as an antenna.

Change the frequency xtal osc and/or divide ratio for other frequencies.

Find the diagram as a JPG image file in the newsgroup alt.binaries.pictures.misc

Guess I will follow up to everyone here.

Depending on where you lived, landline and cellular phone calls could not be placed for one to two hours after the earthquake occurred. As I noted accurately in the online story, this occurred because of system overload. The story is very straightforward, points out that only minor (or moderate if you lived near the epicenter) damage occurred and does not overly dramatize the situation.

If you are suffering a medical emergency during a phone outage, you don't care if the phone is out because of overload or breakage - bottom line is you can't call for help. I, in fact, suffered a medical emergency earlier in the day that the earthquake occurred and was very much aware of the importance of having an operating communications link. Incidently, the next day, a heart attack occurred two blocks from my house (which sadly, ultimately proved fatal)? Who are you going to call when an emergency striks and your phone doesn't work?

The point here is that when the phones are out, the lifeline that people expect to use is not available. If you DO NOT have an emergency, then use of the phone does not matter to you. If you have an emergency, then it matters a big deal. Other disaster situations where phone service has gone out have shown that residents will attempt to drive to the nearest source of aid - typically a local fire station or police subdivision. Unfortunately, they didn't have communications either during this phone overload outage situation.

The local ARES/RACES plan is currently being modified to provide backup communications support at the site of ocal government agencies (e.g. fire stations) during telephone outages. Even though there was no "major emergency" and no one died - the point remains - a hell of lot of people could not have

called for assistance if they had needed to. That is the kind of communications outage for which ARES/RACES should be providing solutions.

This quake is yet another reminder to have the proper plans in effect *before* someone gets injured or dies. The story seems useful to others who are also designing emergency prepardness plans.

Incidently, since a few readers don't get it: Ham Radio Online is a hobby - it is free to you, self-funded, no advertising. Its an online ham resource. Some people build repeaters for other's to use - we decided to build an online ham radio resource instead.

From: mac@cis.ksu.edu
Message-ID: <mac.831953534@zaurak.cis.ksu.edu.cis.ksu.edu>
Source record: 105459

I recently purchased two of the little 199.9 mv full-scale 3-1/2 LCD
digital panel meter modules that sell for $10 each and was surprised to
learn that they can NOT measure the same voltage which powers them--in
other words, they MUST have an "isolated" power-supply voltage. Of course,
I can always use a 9-volt "transistor" battery, but I wanted to used them
to monitor emergency (battery) power supplies, and needing another battery
is "the pits"!

Any suggestion(s)? Did I purchase the wrong module? (I received "PM-128"
from an unknown manufacturer.)

Coil dope is typically made by dissolving polystyrene in acetone, so "real"
coil dope is also highly flammable and toxic until it dries. You can make
it yourself quite easily with styrofoam and acetone from the paint store,
but do handle it and the acetone carefully. As Siegfried said, it's very
flammable.

I never have figured out how applying coil dope would improve a coil. The
best quality dope will degrade the Q by decreasing the apparent inductance
due to increased capacitance. Many other materials used for dope will
introduce loss as well. Maybe someone could enlighten me.

>. . .

I've built quite a few of these oscillators, and 100-200 Hz warmup drift is typical, quite repeatable, and due primarily to the inductor, when NPO capacitors are used. A systematic way of compensating the inductor drift by replacing part of the capacitance with temperature-compensating units was discussed in an article by Wes Hayward a few years ago in QST.

I've heard reports that greater drift than a couple of hundred Hz was traced to poor quality NPO capacitors, and replacing them with good quality ones cured it.

>driven amp of this type and was woundering if there is someone out there that
>might be able to give me some feedback on this.

The object is to lower the grid impedance so that any capacitive
feedback from the anode is attenuated enough to prevent oscillation.
If the tube is run class AB1 (no grid current) the drive power is
dissipated in the grid resistor. The required drive power is whatever
it takes to get the desired grid voltage swing.

This also removes the necessity of having to tune a grid tank -
assuming the driver puts a reasonable rf sine wave into a resistive
load.

It should work fine.

I don't recall the parameters of the 4CX1600B, but I've looked at its
UHF cousin (4CX1600U) for use as a 1500 W amplifier at 1296. It looks
like a great tube.

I have a second computer don't laugh 8086!

Is there any packet receive software I can download from somewhere
which will run on this machine. I do not want to go and buy an
expense TNC so is there any sort of interface able to be build by
the homebrew user - such as that available for the HAMCOMM package.

Thanks.
Piers

The only purposes I've been able to figure out are that it keeps the windings from moving (if touched, or from microphonics), and it seals the coil and form from humidity in the air. You WILL see a change in inductance if your cardboard coil form is sopping wet, has fungus growing on it, and the powdered-iron slug has gotten rusty....

I haven't measured a change in perfornamce by adding coil dope (and I have used a wide variety of glues, besides nail polish), but I've seen significant degradation caused by damage to an unprotected coil. As in, "Oops, I didn't mean to cut through that 30-ga wire winding..."

As near as I can figure, the only advantage of coil dope is that it mechanically secures the turns of wire. Without the dope, it is possible for the wire in a loosely wound coil to shift, changing the coil inductance.

This is probably best prevented by winding the coil turns as tightly as possible, and as neatly as possible, thus making it difficult for any movement of the wire. If the coil is wound with small diameter wire, a drop or two of adhesive securing the ends of the coil is probably a good idea.

Hi Jerry,

We were talking about this briefly in another thread.

In article <ellope.39.0015D5B0@shasta.com>, ellope@shasta.com (jerry)
writes:

>
>I am thinking of building an HF amp. useing a 4cx1600B. The manufacture

that
>
>might be able to give me some feedback on this.
>

On the grid resistor, the **peak** grid-cathode RF voltage can not be allowed to exceed the bias voltage in AB1. This "rule" requires a grid-cathode resistance of around 18 ohms for 90 watts of drive and 56 volts bias. The correct AB1 formula for a simple shunt grid resistance is:

R=Eg^2 / 2Pdrv

Where Eg is the bias voltage and Pdrv is the peak power available at the grid.

A 50 ohm L pad can be calculated using ohm's law: .707bias / sqrt(p/50) = Rgrid. The input series R would of course be: 50 - Rgrid = Rs

With 90 watts and 56 volts of bias, 30 ohms of grid-cathode shunt resistance fed by a series 20 ohm resistor would provide both proper grid resistance and exciter loading.

In many cases, a simple 50 ohm resistor will create problems. The problems are:

1.) Most exciter power control and ALC circuits allow considerable overshoot at reduced power settings, and some overshoot even when operated at rated power. This will cause splatter.

2.) Some or most modern exciters produce dirtier voice modulated SSB signals at reduced power.

3.) PA stability may be reduced from improperly high swamping resistor values.

Be sure to consider these "side effects" when using grid driven tetrode circuits:

1.) A well regulated, protected, and metered screen supply is necessary.

2.) Proper bypassing of the tube is more difficult than with a triode.

3.) Distortion and splatter increases rapidly with the slightest amount of mistuning or excessive drive. It is impossible to accurately monitor proper drive and loading on voice with conventional metering systems.

4.) Layout is generally more critical.

The tube is much less expensive than a comparable high mu triode designed for SSB or GG service, but this is offset somewhat (if not completely) by added circuit complexity. The main concern is the operating and design difficulties. I would suggest reading as many tetrode design articles as you could before deciding on the exact design you want to choose. There are some very well written technical articles published many years ago when tetrodes were more popular that are worth looking at before starting your project.

>Roy Lewallen, W7EL
I do not think that the "dope" is to improve any quality of the coil,
but, instead, just to hold the wires in place. If the wires are not
"fixxed" then the L can varry, especialy with any sort of mechanical
shock or vibration. The dope could also keep water off the wires.
I had some dew ruin a nice home made vfo when the litz wire got wet.

If the meter modules can share the power ground with the signal ground,
just use a 555, in the astable mode, followed by a diode to generate an
isolated volatage. If the power ground and signal ground have to isolated,
use a 555 to drive a transformer, and rectify the output of that. For
a general idea, check out the ARRL handbook and look at their nicad
carger that boasts the 12v from and automobile. They use a 555 driving
a "totem pole" transistor output, followed by a voltage doubler, to get
+24(or so)V. Drop the voltage doubler and either rectify or couple to
a transformer,...well you get the idea. It is a bit of a hassle, but
worth the effort.
Good luck and fun monitoring

If you can't or don't want to power the OP amps you can build a
transformer type hybrid to do the same job. It will have a loss
of 3 dB. I can't quote the connections with out looking them up.

The specification to look for is "common mode input voltage". Assuming they have a differential input (in+ and in- terminals), there is a limit on what voltage can exist between the two inputs and the power supply (the meter reads the difference between the two, but it will malfunction if the absolute voltage on either is out of the common mode range). Most likely, the in- (or maybe in+) terminal is connected by a low impedance to the power supply, either minus supply, plus supply, or halfway inbetween.

The way to find that would be to short the inputs together, supply power and measure the voltage between the inputs and the supply with another meter. Check which pin, if either, tries to sink or source current. Then set things up so that the common mode voltage at the inputs is the same as it's natural value. The resistor divider that scales the 12V (or whatever) battery to less than 200 mV can be connected in various ways so the common-mode input voltage is correct.

I recently wound a plate choke for a linear amplifier using 26 gauge magnet wire on a ceramic form. After it was wound, I gradually removed turns from one end so that the internal series resonances of the choke didn't fall on any of the ham bands. The choke ended up with resonances at about 26.5 MHz, 33 MHz, and several others above that frequency. The highest I measured (with a GDO) was about 120 MHz.

When the adjustment was complete, I secured the loose end of the coil with a dab of superglue, then I dipped the whole coil in polyurethane varnish. After the varnish dried, I went back and checked all the resonances again. If anything had changed as a result of the varnish, it wasn't detectable by any means I had available.

For the ultimate in protection, a coil like this could also be soaked or "painted" with polyester resin or epoxy. Both of these are used as the base in fiberglass, so the effect on Q should be minimal.

jpotter@jpaw.com (Jim Potter) shared the following priceless pearls of wisdom:

>Heat.

I've gotten some good results by spraying a full wet coat of enamel onto the surface to be wrinkled, letting it dry to tacky, then spraying a thin coat of the same color lacquer over the enamel. Sit it in the sun for an hour and it will wrinkle. Evidently the solvents used for one attack the other.

I am building a 450 ohm, non-inductive dummy load. I found what appears to be a surplus load. It have 4 black "tubes"; 2 each in parallel with the two pairs in series. Looks like it is close to what I am looking for.

I want to know if the resistors are non-inductive. Again, they are black tubes, about 2 inches in diameter and over 14 inches long. There are some markings. They are:

Carborudum Co.
892 SP451K
450 Ohms P/M 10%
750 Watts

Anyone have any clues about these BIG resistors?

Chuck Bland - n6dbt

I was involved with W2SZ/1 back in the late 80s - early 90s. During
contests, 2 meters was too crowded for preamps most of the time.
The receiver we used needed high dynamic range, not low noise.
I'm not sure about 6m, but I would expect the same was true.
Maybe one of the current Zed crew could comment more on this.

Years ago I tried coating a toroid coil (wound on type 6 powdered iron, of Q about 250 as I recall) with various materials and measuring the change in Q. I don't have the notes any more but recall that all but a few materials noticeably degraded the Q, some badly. Ordinary epoxy glue, as I remember, significantly reduced the Q. I wouldn't expect this to present a problem with an RF choke. But I wouldn't use it for coils intended for an oscillator tank, filter with high loaded Q, or other application where Q is critical.

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
May 19th, 1995
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 400 sellers and
free, off-street buyers parking!

Buyers admission is $4 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $10.00-each at the gate.

The flea will be held at the corner of Pacific and
Landsdowne streets in Cambridge; half a block off
Albany St near Central Square from 9AM to 2PM,
with sellers set-up time starting at 7AM.

!! RAIN or SHINE !!

Talk-in: 146.52 and W1XM/R-449.725/444.725 (PL 114.8/2A).

The Stamp Faq is done very well and I like to see it here every month.
Perhaps Mr/Ms Anonymous should quit playing with the anonymous servers
and find a real ISP and get rid of that 300 baud modem. Netscape is
pretty slick these days. :-0
Alternatively LOSA can be reduced to a one page summary with just the
http or ftp pointers and maybe an automated email return mailer (like
archie).

The main reason I like to see this faq is because with a Stamp a
person new to electronics can actually be up and running in a couple
of hours and that includes putting all the parts together on a
breadboard.
My stamp I works fine with my 8-bit PC running Dos 3.x and I had
a simple test program running inside 10 minutes. Most of the commands
are rather simple to use and it's a great way to get into building robots.
(I think this applies to most of the other newsgroups listed in this
post's header.)

Also I would like to thank Christer and others like him for their
time and effort in providing these faqs for the rest of us. It sure
helps us a great deal with our hobby or work projects. Thanks!

This probably really belongs in rec.radio.amateur.space (or sci.sat or
whatever). I will keep this real short. Contact the ARRL and get
Dr. Ralph Tagerts 3rd edition of his wx sat handbook. Go to the
amsat ftp site and grab JVFAX 7.0 (7.0 and 7.1 are both on the net,
7.0 supports GIF images, 7.1 supports TGA(Targa), I prefer gif's).
You will need a vhf receiver(I use a Radio Shack Pro2004) and an outside
antenna. A special antenna, with a preamp will give the best results,
but you can use a diskcone. The receiver must at least have a wide band
width mode, Ideally you need a receiver with 45/50KHz BW, but 75KHz(the
wide mode on the Pro2004/5/6) will work. Hamtronics makes a dedicated
reciever. If you are going the JVFAX route, you can use the "simplest"
decoder(a self powered opamp demodulator) with the Exar2201 "front end".
A wesat image is an AM signal on a FM carrier and you will need the
exar circuit to convert the AM signal into an FM signal. I know that
this is confussing, but it will work.
If you have a soundblaster, the funet (in Finland) has two programs(Channel
and demo-ftv(this demo will not save but will display, it only cost
$10 to regester ftv and is well owrth it!) that "decode" the audio and
display a WEFAX image. Channel(expands into ChannelX) has documentation
in Finish. Do a web search for drig(Dallas Remote Imaging Group),

They have a lot of information on all aspects of space. Drig has a program, SBDSP that will convert a wav file(recorded with your sound card) into a img file which you should be able to display with Aptcap40. I have not had anyluck with the SBDSP route(but others have had good results. The Demo-ftv is great, good documentation etc. ChannelX works, but I can not read his docs. JVFAX 7.0 (with the simple opamp and "front end") work very well, even with a diakcone and a Pro12004. The Tagert book is full of information on both the low orbit and the Geosynch "birds". His section on displays is a litle dated(what isn't these days) but the rest of the info will really help. His simple antenna really works.
I hope that this rather disjointed reply at least get you going in the right direction. While you will get the best results with the "proper" equipment, you can get exciting results with simple equipment and start on the road to better results by improving your equipment and knowlege a step at a time. I started out with JVFAX, a Pro2004 an a diskcone. I imprved the antenna next(a "cut" turnstille with preamp), next a real demodulator (a A&A mutlifax demod) and last an outboard IF strip for the Pro2004. My next upgrade will be a dedicated receiver.
Good Viewing!

You're in luck. These are non-inductive resistors made of bulk
material. Carborundum is now owned by CESIWID (or something like
that) if you want more info. I don't have my catalog handy, but the
only other information they would have that you don't already know is
the peak voltage and the peak energy ratings which are useful for
pulse applications. but don't matter for rf.

One caveat is that the resistors are slightly nonlinear with voltage
and they increase in resistance when the get hot (as much as 20%).

None of this matters much for an rf load.

Here the situation, I'm just starting in on this radio thing and I'm having a problem figuring out what is best. I started with a couple of 49 MHZ radio shat in pocket communicators so I could play paintball and talk to another member of my team at the same time. I quickly found out that the refs use the same frequency and that the rang and clearity wasn't that good. I nneded something that would work better since I didn't have time to play around with things while I was playing paintball. I also tryed to use these in the car since we travel in multiple cars a lot and I thought it would be nice to be able to talk to each other. At any rate this didn't work. I returned them and figured I would give a CB a shot. It started out really good, then I realized that the CB (a hand held one) would be great for paintball, but not very good for the car since it picked up every little electronic devise in my car, since I have a stereo well over $1000 and an alarm to guard it along with a radar detector to watch for police oh and I can't forget about the pager and cell phone. Anyway you get the point, I'm into electronics. So now I hear all about these HAM radios, and VHF. How far can they reach and what kinds are the best, how much do they cost, where can I get them, are there a lot of people using them? You get the idea, I have no clue about them. I know I need a licencse and that's about it. Some one has been a great help to me so far, any more help would be greatly appreciated. I am extreamly interested in what the benefits are off having the VHF as opposed to the CB. Well please get back to me, one of the more important things is cost and range. I want to creat a docking station for it for my home and for my pickup truck. I am very interested on how far people think they can go. Please email me at bprender@lynx.dac.neu.edu with any help. I don't read these all the time so I would probibly miss any resonse to this. Thanks for any help at all......

Tom,

You're sorta out of luck in the Philadelphia area. I know of a guy that has a warehouse in Bridgeport, Pa., about 25 miles west of Phila. (near where I live). He is not open on a regular basis. He does go to hamfests and usually is at Dayton. I'm not aware of anything else of significance in the area and I've lived here for over 25 years. Maybe some of your other responses will prove me wrong.

Does this mean I can use any size powdered iron core toroid I want at any frequency, up through 2 meters, so long as it doesn't get too hot to touch? This is for SSB/CW transceivers and transverters, where I'm worried about IMD, and usually use oversized cores due to fear and ignorance.

With some newsreaders/ISPs you just say which groups you are interested in
and all the news is automatically downloaded. With others you won't know
the size of an article until you look at it.

While I don't agree with the original complainer, I can see his point
about large articles. When a periodic posting gets large enough it ought
to be tucked away at some ftp and/or web site and just a reference to it
posted.

I am more disturbed about some of the followups, though. Besides rude
(name calling) and uninformed ("All newsreaders must be like mine") ones
like the above there was another person (whose sig IDed him as an
"Internet instructor" nonetheless) who said

> This is the nternet. It isn't your responsibility to be concerned
> because some people have access that costs them more money
> for more news. Post as you see fit.

Wow. Sure, post anything you want! Don't give a d*mn that you are
costing others money and grief! Use 100 line sigs! Add one line to
1000 line quotes from other messages! Spam to all the newsgroups
at once! Make Money Fast!! Sigh.

3085. Latest Version of Filter Design SW Available

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-14 00:00:00 UTC
From: blombard@iu.net
Message-ID: <4nattd$eoi@cc.iu.net>
Source record: 105413

Announcing FilDes 2.01

I would like to draw your attention to the release of the newest version of my filter design program, FilDes (also known as FDS). FilDes 2.01 is a minor revision to correct a couple of bugs in the release of 2.0. FilDes is copyrighted to prevent others from using or selling my code, but is free for all users.

FilDes 2.0 brought the following features to the program.

* Design of Bessel (flat group delay) LP, HP and BP filters
* Design of Gaussian to -6 and Gaussian to -12 dB filters in LP, HP and BP.
* Design of Linear Phase with 0.05 and 0.5 degree equiripple phase error filters in LP, HP and BP.
* Extensive support built-in for ARRL Radio Designer (r) from the ARRL and Compact Software(r).
* Computation of duals of LP and HP filters for ease in diplexer design or more realize-able component values.
* A filter "estimator" for Systems Engineers, and others who don't want to build filters, but need to know how much filter they need.

The following FilDes features are still there, or have been improved.

* Design of LP, HP, BP, BR and narrow BP filters in Butterworth or Chebychev transfer functions with .001 to 3 dB of ripple.
* Design of Elliptic (Cauer) LP and HP filters.
* These designs carried out by synthesis, not look-up table.
* Calculation of the order required from these filter types to meet your attenuation requirements.
* Output to text printer or Touchstone (r) .CKT file format.
* Estimate of midband insertion loss for BP filters, based on component Q.
* Online, context-sensitive help.

The program comes with a companion utility called Airwndl (Air Wound L) which calculates the number of turns for an air-wound single-layer solenoid coil. A complete description of Fildes2 is included in the file FilDes2.doc, and also as a Windows 3.1 Write (r) file, FilDes2.wri. Everything is in a zipped archive called FDS201.ZIP. It is available at ftp.ee.ualberta.ca in the directory /pub/cookbook/softw/ibm and in the QRP-l archiveas at ftp.lehigh.edu, where it is currently found in /pub/listserv/qrp-l/tools.

73,
Bob

Statement of contribution policy: I never turn down cash, but send it
only out of undying admiration, not because of nasty shareware warnings.
FilDes is freeware.

The following bit of "mock legalese" is lifted from FilDes2.doc:

Trademarks, copyrights and the like

FilDes is copyright by Bob Lombardi.

HP, EEsof and Touchstone are registered trademarks and copyrights
of what is now HP/EEsof. HP is a registered trademark of the Hewlett
Packard Company. The ARRL is the American Radio Relay League, the US'
national amateur radio organization. ARRL Radio Designer is copyright
by Compact Software, Inc., and the American Radio Relay League. Windows,
and Windows Write are trademarks and copyrights of Microsoft Corporation.
I have no connection with any of them aside from being a member of the
ARRL.

>Dick Arnold, W5VEC
>dick@netcom.com
If you can't get the spec's. you can get most of the info. you
need by measuring the size of the core and from that determine
the power capacity. The winding ratio can be measured directly
by putting a small amount of signal on one winding and measuring
the other winding. There should be two windings one of which is
usually center tapped for a push pull amplifier. The current rating
can be determined by measuring the resistance then running current
through and checking the increase in resistance. from that you can get
the temperature rise. The total transformer should not be over 140
degrees MAX. cooler is better. I have never done the temperature
experment so am probably not totally correct. Maybe others can
provide better details.

Ditto for me...LOSA should be posted here..that way more
readers will be able to work with embedded controllers. Just reading
what others are doing is helping others get started. The stamp has
paved the way for things to come..New paradigms are always
resisted by those who are established in the old ways of doing things.
Oh yes...I've done my share of assy, eprom burning and it was the
main thing that kept a lot of otherwise able technicians/hobbiests
and researchers out of the field..Not anymore.

Anyone here has experience on building LiearAmps?

What is the best:

To use Lamps... or
To use MosFets ?

Mosfets from Motorola, bring a power of 600W from a input
of 10W.. so how do I match my 100W output to an Amplifier based
on this device?

Any ideas... please give me a call..

>I have used a wide variety of glues, besides nail polish), but I've

Well, for what it's worth, I've measured the Q of toroids dipped in plain old polyurethane varnish, the kind you'd finish furniture with, and it has a fairly insignificant effect at about 10 MHz or less.

The only advantage I know of is mechanical stabilty, which might matter if the rig is subject to vibration or shock. Sort of similar to dripping beeswax on your coil slugs, I guess.

I am trying to identify the value of the variable capacitor used
in a 6metre stripline filter as depicted in ARRL handbook interferance
section.
The capacitor in question is a Hammarlund HF-30-X.
I know I could build it and then tinker around with various capacitors
to get it working but heck there must be someone out there that already
knows the answer.
In anticipation Dave G6UWO.

Also a to thick of layer of paint will wrinkle sometimes.
The top starts to dry before the paint underneath has a
chance and this will cause wrinkling.
So two coats are better than one thick coat, unless you
want the wrinkle.

Consider the following also.

Circuit operating (loaded) Q affects the power handling capability. Higher operating Q's mean lower power handling for a given core size.

As a general rule, you can not short taps on the winding of a toroid without reducing unloaded Q and efficiency, and increasing component heating. Especially in a high loaded Q circuit. Yet this must be done to avoid arcing and unwanted resonances when a coil is used over wide frequency ranges. There are some exceptions to this, but great care must be taken to avoid trouble.

Toroids, when used in the high Q section of a tank, always decrease harmonic suppression and lower efficiency when compared to well designed air core tank coils.
In my view if you don't have a real space problem, stick with air wound coils and save yourself from potential headaches.

> ignorance.

Wes Hayward *speculated* about this on page 226 of Solid State Design. I tried measuring the IMD 8 or 9 years ago with really tiny iron powder cores didn't find anything worth publishing. Similarly, I tried shorting out a turn of a toroid and measuring the Q degradation on the Q meter. This time I did measure a small change, but not really enough to worry about when designing reproducible circuits. To me, this seems reasonable when you consider the relatively low permeability of the high Q materials used by amateurs at RF. In school, we often made the simplifying assumption that all the lines of flux were in the core--not a good assumption here.

It isn't all that difficult to make a 2 meter test fixture. You can combine signals from a pair of HTs in a 6/4 wavelength hybrid ring and listen to the output of the device under test (suitably attenuated) with a highdynamic range SSB/CW receiver (perhaps a direct conversion design).

> To use MosFets ?

I personally prefer tubes, at least for fixed station use. The low cost of 811A's makes four of them a prime choice for this power level. When I purchased my amplifier used about six years ago, I selected it on this basis. It uses four of these tubes and will output about 750 watts CW (not 100% duty cycle) and better than 1 KW on SSB.

572B triodes, the big brother to the 811A, will provide greater plate dissipation but they are considerably more expensive per watt and don't seem to be as efficient. In addition, four of them in parallel can be difficult (but not impossible) to stabilize. If higher power levels and duty cycles are desired, a single 3-500Z is probably a better choice.

>Mosfets from Motorola, bring a power of 600W from a input of 10W.. so
>how do I match my 100W output to an Amplifier based on this device?

Assuming there's no driver stage that can be bypassed or removed from the amplifier circuit, you're pretty much stuck with either reducing the power of the transmitter or using swamping resistors. The latter is preferable from the standpoint of minimizing distortion products, but it wastes power.

>At least a couple of these groups (the rec.radio.amateur ones)
>are gatewayed to mailing lists, and posting large items to them
>is guarenteed flame bait.

The fact that some newsgroups are gatewayed to one or more
mailing lists should not be a consideration to what gets
posted to any newsgroup. As long as there is reasonable
subject matter related to the newsgroup, the various net.censors
should have nothing to complain about. If and when traffic
in any newsgroup is a problem for a list that rebroadcasts
as a mailing list, then the mailing list administrator has to
consider those situations.

In another post I commented that it isn't a poster's responsibility to
be concerned about those individuals that have a more
expensive access (time and usage charges, etc.) That's
true. IF you want to worry about the person that pays
more for access because of content volume, that's
fine, BUT the majority of net access isn't oriented that
way and it is, therefore, a personal decision if a poster
wants to minimize length. That's no different than
web page creation. Sure you can complain that some
web pages have too much graphics to download,
but that is a matter of the web page creators choice.

The internet is open to many, some have limited
access (low modem speeds, etc), but that shouldn't
limit posting by the vast majority. I once only had

a 1200 baud modem, I upgraded, so did millions of
others. That is the evolution of technology. So be it!

3109. UHF "grid" dip meter

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-15 00:00:00 UTC
From: hjohnson@pluto.njcc.com
Message-ID: <TtbcnuoWW$tF079yn@pluto.njcc.com>
Source record: 105345

I'm building a radio telescope at 400 MHz. One of the problems I have is trying to tune it and balance it. Seems hard to find used gear that will work at 400 (not 440!) MHz. Most dip meters are lower - 200 MHz or less. In an older ARRL Handbook, I found a grid dip meter using a Nuvistor - 6CW4 - circuit good to several hundred MHz. It's interesting that it's hard to beat a vacuum tube for low input capacitance. The 6CW4 boasts a fraction of a pf for grid capacitance. This appears to keep the loading down on the resonant circuit and thus increases its sensitivity. So, a ham friend of mine is preparing to build it. I'm a digital EE so this UHF stuff is a bit out of my league - but it's a learning experience!

Does anyone challenge the above statements? And can they offer a semiconductor alternative that would work as well? (Short of buying some umteen $$$$ piece of equipment.)

Amidon states that "With a normal sinewave signal above 100 KHz,
both the Iron Powder and Ferrite type cores will first be affected
by overheating caused by core losses, rather than by saturation."
In keeping with this statement, the flux density limits recommended
in the Amidon catalog are related strictly to overheating and are
well below levels that would cause saturation.

Heating is not necessarily the limiting factor in SSB and other
linear modes with a high peak-to-average power ratio. Saturation
is still a concern and you must determine whether the peak RMS
voltage across the winding will cause this condition. To play it
safe in making calculations, I always assume that the peak capability
of the transmitter is actually the average power output. If this
power level is used with the Amidon flux formula and the result falls
below their recommended maximums, it is safe to assume that saturation
will not occur.

As a side note, the recommendations published in the Amidon catalog
only cover the frequency range from 1 to 30 MHz.

Posting-Frequency: posted on the 15th of each month

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October 1994 to add the discussion of non-Usenet mailing lists and streamline most of the history discussion, and to change the moderator information for rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

3118. Voltmeter using ammeter?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-16 00:00:00 UTC
From: lumkes@cae.wisc.edu
Message-ID: <4ne42c$17bk@news.doit.wisc.edu>
Source record: 105346

Hi, wondering if someone could tell me an easy way to
use my old ammeter (1 mA FS) to show 0-FS using only the
range of 11-14 volts. Is there an easy way to have the
scale reflect only this voltage range and not the
whole 0-14 volt range?

Thanks, John AA9QP

>Higher operating Q's mean lower power handling for a given core size.

This is true as long as the term "operating" Q isn't overlooked.
Regardless of inductor Q, it's the voltage across the windings that
will determine flux density. If that voltage is restrained by the
impedance of the circuit that the inductor is installed in, the Q of
the inductor itself (within reaason) will be of little significance.
The Amidon formula for flux density does not require entering either
inductor Q or the specific core material. Note that it also assumes
that none of the turns are shorted. ;)

<good info deleted>

>potential headaches.

It's funny that you brought this up. I recently had an e-mail
conversation with someone attempting to do this. My advice was
that he should use a separate toroidal inductor for each band,
rather than bandswitching a single device. When this is done,
the perceived advantage of space savings usually attributed to
toroidal designs completely disappears, as do any possible
economic advantages.

Yes, Ascii schematic follows (use monospace font)

```
(+) ---------|<|---------/\/\/\/\/\-----(meter)------- (-)
ZD1 R1 M1
```

ZD1 is a zener diode at approximately your low voltage
... 9.1 volts is quitecommon. So if you use 9.1, the meter
will read 9.1-FS

R1 sets full scale. Select by:

[(Desired Full Scale) - (Zener Voltage)]/FSmeter;

for your project that is (14-9.1)/.001) = 4900 ohms

(to be absolutely accurate, take into account the meter
resistance ... but DONT measure it with an ohmmeter!)
IE if meter is 380 ohms, then the resistor would be
4900-380 = 4520 ohms

for casual use (ie storage battery monitoring) this is adequate,
but realize that a zener diode is not "flat" and that the
voltage accross it can move about 1/2 v from "just conducting"
to FS; that is why I would use 9.1 V and throw away all readings under
about 10-11 V.

Hope this helps.

The first step is to set up the meter with an appropriate series resistor so that it provides full scale deflection at 3 volts. Then, place a combination of zener diodes (and/or forward-biased diode junctions) in series so that exactly 11 volts is dropped by the diodes. This will prevent any voltage below 11 volts from causing deflection, and 14 volts will be reduced to 3 volts at the meter, causing full scale deflection.

There was a similar discussion recently on one of the rec.radio
newsgroups. The topic was whether binary files should be posted,
and the overwhelming consensus was that they should not. The
reason given was exactly what you are attempting to dismiss, that
is, the inconvenience and cost incurred by those who subscribe
to the group through a mailing list.

Powered iron has three properties compared to ferrite that mean
you probably don't have to worry about IMD:

1. Being made of iron, not iron oxide like ferrites, the saturation
flux density is on the order of 2 Teslas, not .2 to .4 Teslas like
ferrites.

2. The core loss is typically higher than ferrites.

3. The permeability is quite low.

The combination of these properties means that it is practically
impossible to saturate a powered iron bead because it will burn up
long before you can saturate it, unless you were hitting it with
low duty cycle pulses. (SSB has too high a duty cycle for this).

HOWEVER, it is still possible to get IMD effects without going
anywhere near saturation. For example, if you build an oscillator
with a ferrite core inductor and locate it near a 60 Hz. transformer,
the stray magnetic field (only a few milliTesla) will modulate the
permeability of core and FM the oscillator.

I would still be very surprised if this IMD got up to a level that
would be significant in terms of an SSB transmitter, where the
3rd order intermod is only 30 dB. down to begin with.

We don't know what Dave's interference problem is, but high-Q bandpass filters are a deeply unpleasant and potentially dangerous way of dealing with interference problems.

If the interference is being caused by spurious signals from the transmitter, these are almost certain to be harmonics rather than close-in spurious products. (This is especially true of 50MHz where the 2nd harmonic falls in the FM broadcast band.) If you're trying to suppress harmonics, a bandpass filter is quite inappropriate, and especially the type based on a single high-Q tuned circuit.

Why? Because in order to achieve worthwhile harmonic suppression, the loaded Q must be very high. Insertion losses are proportional to the ratio of (loaded Q):(unloaded Q) and will be quite significant, especially with high power. A high loaded Q and high power may also cause arcing across the tuning capacitor. What *is* the loaded Q value, anyway? It's all controlled by the placement of coupling loops, and without testgear you're working in the dark.

Also, mistuning a high-Q circuit can reflect some very nasty load mismatches back into the PA. That's where the "dangerous" part comes in. Mistuning could easily cause excessive SSB intermodulation distortion from solid-state finals, which is dangerous to your on-air reputation; and in the limit it could damage the PA (symptom: severe stabbing pains in the wallet).

If harmonics are the problem, filter out the harmonics. It may not even need a lowpass filter, because there's already one of those in the rig. Very probably, it's only only one or two harmonics that need specially-good suppression. A notch filter made from coaxial cable can easily take out the offending harmonics with very low losses and a low VSWR on the fundamental frequency. G4SWX has published some "KISS" designs in recent issues of 'Radio Communication' (RSGB) which are very simple to build - just a few pieces of coax teed together.

If it's a receiver problem, the way to get rid of interfering signals is to use repeater-type notch filters, which are quite broadband on the wanted frequency. A single high-Q tuned circuit is a wonderful way to see if your preamp or RF stage will oscillate!

High-Q bandpass filters were never a good idea, and the only reason they keep appearing in books and magazines is that amateur radio publishers are far too fond of recycling (the ARRL design goes back to QST for 1964, and the RSGB designs are the same era).

I can't think of any interference problem that couldn't be solved in a better way.

>about 10-11 V.

This circuit is a good start and will do the job, I can suggest two
enhancements:

(1) Put a forward-biased regular silicon diode in series with the zener
diode (the starting voltage will increase by 0.6 to 0.7 V over the zener
voltage). This will counteract some of the variation of zener voltage with
temperature. Also it will protect the meter if the circuit is hooked up
with the wrong polarity. The regular diode will not conduct the reverse
polarity, thus the meter will stay at zero. In the basic circuit, the
zener will go into forward conduction and flow several times the full-scale
current, slamming the needle against the zero pin.

(2) Shunt some current through the zener so the zener current is higher and
thus better regulated. It would be nice to be able to make zener current
flow constantly (even when the battery voltage is less than the zener
voltage), but this would require a source of negative voltage. In order to
keep the circuit simple just hook a resistor from the zener anode to the -

battery point. Usually zeners work best with about 10mA forward current, so design the resistor so the zener current is about that at the usual voltage (12V). This modified version will use more current from the battery, so it may not be suitable for continuous monitoring. Connect the circuit to the battery through a momentary switch so current only flows while reading.

In order to get more precision, a rather advanced circuit involving a voltage regulator or reference and maybe an op-amp or two would be needed. This would have the advantage of being able to precisely set both the starting and maximum voltages though.

An 11 volt zener diode and a 3000 ohm resistor will do it in
principle. The only trouble is that the zener is not precise. You'll
have to select from a batch of zeners, use a variable trimpot
resistor, and recalibrate the scale.

For precision, use a differential op amp.

Good Luck. Was this a class assignment?

>

I have one, but it is currently sitting in its box on the bench
waiting to be assembled. The manual looks very thorough and
well laid out. They did have some problems sending it to me,
seems its a very popular kit, mine was backordered (but still
only took about 4 weeks to get to me).

I'm going to try to get started on it this weekend, send me a
message Tuesday if you want to know how far I got.

later,
Dean.

> hacker saw-filters?

An interesting idea, but probably not possible. If it will work, all
you should have to worry about is plating and etching the electrode
structure. Remember that SAW means Surface Acoustic Wave, and the way
that is done is by using an interdigited electrode structure on the
surface to launch waves along the surface. The base piezo outside
dimensions don't mean much (other than re physical reflections from the
edges.) The important thing is the electrode spacing on the surface.
This where the next problem is. It is an acoustic wave in the material.
Figure the dimensions of a wavelength of sound in a solid at RF
frequencies. It is very small, consequently the lithography problem
pushes the state-of-the-art, in some cases they use E-beams to direct
write to make the patterns. Another problem I suspect (since I've never
made these) is that the typical piezo-buzzer is an amorphous powder that
has been pressed, sintered, and high-voltage poled across the thickness.
You could repole your electrodes on the surface by holding the voltage
on them while heating the part through the Curie temperature, but
probably more important is the fact that the basic structure is these
amorphous grains. The grains will act as a dispersive agent for the SAW
waves you create, in effect, muddying the signal. SAW devices are
single crystals, sawn from a larger boule, in the same way
semiconductors are.
A neat idea, but thought I would toss these postential problems out so
you could watch out for them if you proceed.

Years ago, I worked for an aircraft communications mfg and they
specified blank crinkle or wrinkle paint on all the equipment
they made. It was a special paint that was premixed and sprayed
on, then heat dried. Wish I could remember who made. It sure did
a nice job tho.

Hi,

First I want to thank *ALL* of you that replied either here on USENET
or via personal e-mail... And due to the positive responce I received
I've decided to continue the postings of L.O.S.A but I will only post
it if there is some new contributions since the last posting.

Also when the list grows to big I will post an pointer instead but I
don't consider the actual size (approx. 40 KB) to big so keep the
contributions coming ;-)...

Below is *SOME* of the replies I received via e-mail:

==========

From: Chris Hiner

Below is some of the replies I received via e-mail. Once again thanks
for your support ! I'm in favor of you continuing to post the list...
I'm not currently doing anything that would directly involve using a
STAMP, but it does give lots of interesting ideas....

It's rare I do hardware, but when I do, it's strange things like
monitoring lights on a phone to integrate avoice mail type application
onto a PBX that doesn't do such things...

Although, after seeing some of the things done in your list, maybe
next time I have a need for something like that, I'll use a STAMP :)

Thanks...

==========

From: Gary Coffman

I don't mind the periodic posting, but I usually just skip over
it because I've seen it before. If you'd prominently include
the last update date so I'd know when something new had been added,
it would be more useful.

Gary

==========

From: Garland@2bears.com

I encourage you to post the changes/additions to LOSA about once a month, and post a pointer to the full list (rather than the full list each time).

I don't object to your posting info on the STAMP, although, getting the same information again & again doesn't sit well. (And, frankly, LOSA is getting pretty long.)

Regards,

==========

From: Floyd Brown

I don't mind as long as you don't post the same hints, i rather enjoy them

==========

From: John Lundgren

I haven't read whatever the L.O.S.A. is, but if it is something that is a large document, then the appropriate procedure is to upload it to a FTP site and then advertise the site in the newsgroup. It's poor netiquette to make others suffer because of large posts.

==========

From: Mattias Waldau

It is a good idea to post it, it is interesting too see what people acutually build. I use a 28800 modem and have no problems loading down the news-groups I am interested of.

/mattias

==========

From: Fred Martin

The LOSA is great. Have a thick skin and keep posting.

Best,

==========

From: Greg Sturn

think the information is very worth while and I really apprecitate the STAMP info. Please keep it up!!!

==========

From: Matthew McDonald

I like reading the LOSA postings, and would be sorry to see them go. Please ignore the whiner.

==========

From: fbg@iinet.net.au

I thought it was really quite groovy, and was actually the sort of thing I would like to see more of on the group. For we folk who are toying around with the field, applications of generic parts are very enlightening.

Keep up the good work.

==========

From: Ron Majewski

Chris,

I enjoyed your posting about LOSA and look forward to seeing more in the future. Thank you.

==========

From: James P. Ryan

I missed you article. I was/am having severe news problems.
Would you be so kind as to email me a copy of the article?

Ignore the fool who wrote this note anonymously. It should be no concern of yours if he has to pay for news.

==========

From: Jeffrey Herman

What's this doing in the amateur radio groups? Why is it you folks feel you're exempt from a newsgroup's charter?

jh

==========

From: tomb@lsid.hp.com
Message-ID: <4nfo33$5rt@hpcvsnz.cv.hp.com>
Source record: 105364

Ed Ganger (eganger@mindspring.com) wrote:

: for casual use (ie storage battery monitoring) this is adequate,
: but realize that a zener diode is not "flat" and that the
: voltage accross it can move about 1/2 v from "just conducting"
: to FS; that is why I would use 9.1 V and throw away all readings under
: about 10-11 V.

Ed's quite right about this. Best would be to hand-calibrate the meter, and also then realize that it won't be perfectly temperature-stable, though probably adequate. A couple other things you can do: set the mechanical "zero" on the meter so with no current it's below the scale "zero". This will throw away the readings up to that small current where the scale zero actually is. Provide a mark on the meter face where you've offset the pointer, so you can reset it there if it gets out of adjustment. Also, you can get "adjustable zeners" or shunt regulators that are set with a pair of resistors. A TL431 _might_ work, though it's really designed for more current. You could actually put in a pot to adjust the lower threshold voltage, and it's very "flat" with current. But it takes some current to bias the resistors. Actually, this could make a useful meter: linear scale from zero up to 11 volts, compressed in the first, say, 20% of the meter range, then linear expanded scale from 11 to 15 over the top 80% of the meter's range.

AB5CK Doppler PC Boards - $24.95 (free shipping)

This high quality, professionally manufactured PC board is based
on the popular Roanoke Doppler design shown in the book entitled
"Transmitter Hunting - Radio Direction Finding Simplified".

Special features:
* On-board audio amp (used to reduce display variations).
* 16 LED display.
* Low signal level lockout circuit.
* Numerous bypass capacitors to enhance overall operation.
* Solder mask.
* Silkscreen for easy component location and assembly.

Texas residents add 7.75% sales tax.
Free shipping (to most U.S. locations).

Payment:
U.S. Postal Money Orders will receive next day shipment.
Personal checks are welcomed (requires waiting period).

Seems to me it was a sharpened platinum point barely dipped into a tiny
cup of sulphuric acid. Don't recall the acidic molar strength or what
the metal was to complete the circuit thru the acid. Would assume it
was Pt also to keep from making a cell.

> Thanks, John AA9QP
> lumkes@cae.wisc.edu

For a simple solution, try an low power 11 volt zener diode and resistor in series with the ammeter. The resistor value is chosen so that the total series resistance of the resistor and the meter coil resistance is equal to 3000 ohms (14-11/.001). Consider that the input resistance of this meter circuit is relatively low so that the voltage source you are measuring should have a very low output resistance (such as in DC power supply) if reasonable accuracy is to be had. Otherwise you could make the resistor variable to accommodate a higher, but less than 3000 ohms, source resistance if the meter is to be used in a dedicated application.

I once saw an elegant (and more accurate) solution to making an "expanded scale voltmeter" such as this using a three terminal voltage regulator IC, but the schematic escapes my memory.

3142. ARRL synch. detector

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-17 00:00:00 UTC
From: hugo@infobahnos.com
Message-ID: <4nih5k$3d5@news.accent.net>
Source record: 105283

Hi all,

I am looking forward to build the AM synchronous detector (ARRL '96 Handbook, chap. 15 pp. 32-35) for my SW radio. I'm presently in the process of gathering the components and also looking for more infos as the the article itself is a bit short on this side.

Has anyone tried this project? Did it work as it should?

Are there any errors in the circuit schematic (fig 15.49)?
I'm aware there are many in the layout one (fig 15.50).

Some of the capacitors are marked as C0G type (ex. 1000p/C0G).
(0= zero)
Can anybody explain what's C0G. Would normal ceramic do the job OK?

The article suggest that the a.f out of this detector be reinjected in audio chain of the radio. I would prefer to follow it into a separate audio amp built around an LM 386 (or alike) circuit I would provide. Any wrong doing going this way?

COMPONENTS

There are 2 components I'll have a hard time to find here in Montreal.

1- L1 - Toko RWRS-T-1019Z: 220uH (nom.) VARIABLE inductor.
2- T1 - FT-37-77 Amidon toroidal ferite core; .375" (Normal supplier is out of stock)

Minimum order and/or relative high shipping cost kinda deters me to mail order them. If anyone had any of these parts in excess in its junk box, I'll gladly buy them (again paying shipping cost).
N.B. In the case of the variable inductor, an equivalent part of about the same size and Q would be OK.
Again please email before.

All suggestions will be welcome. Thanks for any help,

Hugues Caron

> umteen $$$$ piece of equipment.)

In the first DUBUS technical book there are at least 2 dip meters
that fit your bill.

The first is a superregenerative dip meter that covers 200-500 MHz
and uses a BF245A JFET + 2 * 2n2222 or similar.

The other one is more comfortable and has ranges from
270-560 MHz
530-940 MHz and
900-1420 MHz.

It uses bipolar transistors and varicaps.
The book is from June 1978 and bi-lingual german/english.

DUBUS is published 4 times a year and distributed worldwide.
It is a communication medium for hams made by hams.
The books are collections of the technical articles of several
years. I think there are 4 books upto now. You'll find a lot of
interesting things such as antennas and antenna mounts, low loise
preamps and other stuff used by hams for earth-moon-earth on 432 MHz.

The contact person in the US is:

Russel L. Miller, N7ART
12041 S.W. Peninsula Drive
Crooked River Ranch, OR 97760

I hope this helps,

Gerhard DK4XP

Its your fault!!! I thought I got crystal radios outta my system last year after my umpteenth attempt to build one failed. Now I read about chemical detectors and you got me started thinking about winding wire and scrounging for earphones.

I'm a chemist by training and the idea of a 'solution' detector really intrigues me. Any idea where I could find more information???

3150. Tube in RF Probe

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-17 00:00:00 UTC
From: gary.j.tennyson@bridge.bst.bls.com
Message-ID: <NEWTNews.832342633.17443.Gary@Techstds.al.bst.bls.com>
Source record: 105373

HI,

I just bought an HP 410C Electronic Voltmeter at a hamfest. It turns out that the RF probe has a small, unusual looking rectifier tube (valve) in it. Although everything seems to work, I was wondering where I might find a replacement for the tube if it ever fails.

It is marked as an 'EA53'.

Thanks

Gary Tennyson

6CW4's are going to be fun to find anywhere. High input impedance?
Why? If the Q of the whole system is too sharp, you might possibly
miss the dip. Go for a vhf (or in this case) or uhf MOSFET.

I am looking for a off-the-shelf, transmitter and receiver boards for integration into a project Im working on, to replace the boards I presently use. The idea is to transmit small packets of data (a dozen bytes or so).

Requirements:

1) Must be cheap -- as cheap as possible. The boards Im trying to replace run about 10 bucks a piece.
2) Must be low power. The boards Im replacing are 5v at 1.4 mA
3) I must be able to key the transmitter with an I/O pin from a microcontroller.
4) The board should already be FCC approved.
5) Range? Up to 100 feet.

If you can direct me to a manufacturer, or better yet, a specific product, I would be overjoyed. Please email any response. Pete.

I've talked to an EE professor who claimed that he has seen ships
on the Great Lakes far beyond normal LOS--optical ducting over
water.

The RSGB Microwave Handbook, volume I, talks about "evaporation
ducting"

I recently built one and am quite satisfied with it. My power meter indicates
12W into dummy load on FM. Phone help is good, I stupidly installed GASFET
upside down, Tenn TEC sent new one free of charge. Did take me quite a bit
more time to assemble than I expected. If you're short on time the assembled
price represents good value.

I've decided to play around homebrewing double & triple conversion receivers in the upper VHF, lower UHF regions and need a source for ones and twoes of those really oddball crystals needed to work in that area. I don't see them in the usual sources, Digikey, Mouser, Newark, etc.

I guess I'm looking for that enthusiast who is selling them out of their basement.

Any leads?

Regards,
Dave rqerce@hercules.lerc.nasa.gov

Here's the best way I know of!

Clark, WB6ADC has a MFJ-249 SWR Analyzer. The nice thing about this battery operated device is that it displays your antenna's specific resonant frequency direct on a 10 digit LCD display, from 1.9MHz~170MHz! No transmitting required.

We set my Quad up on a non-conductive mast and stood clear of any structures, wires and trees. In less than five minuets we had the Quad fully optimized for the input of our repeater! The Analyzer is very reasonably priced, every club should own one!

Hi Homebrewers,
I recently ran a circuit board for a customer that included a 7 watt audio amplifier. The amplifier uses the LM-383T chip and includes the support components shown in the National data sheet. Board dimensions are ~ 2" x 2.5" and the board is double sided plated thru G-10 (high quality). If anyone is interrested in one of the extra boards the price is $7 + shipping. A complete kit, including the board all components, heat sink and connectors (pc connector and its mate) is available for $16 + shipping.

Thanks,
-Chris WA3LDI

You can get one at a flea market in an HP 410 B or HP410 BR- new price is BIG BUX! Be careful- they are hot finds (or they used to be ten years ago)- I remember folks at flea markets opening up the probes on someone's table and stealing the little tube RIGHT THERE and putting it back together w/o the tube.

If you can find a "T" for it for a 50 ohm line , U will have a GREAT "wattmeter". 136v equals 400w, for example. It will be OK thru 400 MHz or so, and will read very accurately.

Multiple copies of "Eagle" Telephones for sale. Each can be used as-is if you have an Eagle network, or salvaged for lots of neat prototyping parts.

Just to get the ideas flowing, consider that each has:

o Epoxy encapsulated magnetic reed-switch (phone handset proximity sensor)

o 1.5" x 7" 20 push-button selector panel. Each button has two colored LEDs and room to insert a small paper label. 34-wire ribbon cable/connectors.

o 12-button high-quality feel phone pad, about 2"x 3", with 8-wire flat ribbon cable/connectors.

o 4-digit LED display, with ":" and decimals built onto the display

o Astec daughter card, 2.5"x 1.5", that appears to be the TelCo interface

o One 4-pin, and two 6-pin J connectors.

o 8 position DIP switch

o One 2" diameter, 8-ohm speaker

o Bunch of ICs: CD4081, HCF4069, 2x HCF4066, LS404CB, 2x ULN2003A, 2x ULN2032, SN75176, AMI 8948 (programmed 8048?), LM386

o 3.579575 MHz crystal

o Two 10k-ohm dial pots

o Beige enclosure. I have only a few handsets/cords. Let me know if you particularly are interestd in the handset.

I'll sell these for $22 or lower, depending on how many you want. Buyer pays UPS or USMail shipping. E-mail or call Brian, 719-472-0707 or morkb@ix.netcom.com.

Getting crystals made isn't particularly expensive, here in the UK,
anyway, even as one offs. You could always use PLL synthesisers to
generate the frequencies you want, from a single crystal. It'll take
a lot longer, but will be cheaper. 8-)

A detector is a non-linear device to rf (ac). Any electrolytic cell
is of course non-linear and can serve as a detector. When I was a
kid in New York City a friend and I made receivers using an AA cell as
the detector (25 cents for a galena crystal was a lot in 1939).
The AA cells were good enough to pull in the 50 KW AM stations
across the Hudson river . Don't know how they would work in the HF
band because when we went to HF receivers we upgraded to vacuum
tube regenerative and superregenerative types. The tubes and parts
came from junked radios. We could listen to "Short Wave"! Great stuff

for ten-year olds.

Dave:

You can get 140 to 170 Mhz. receive crystals from Radio Shack easily for radios that use 10.7 Mhz first IF. They are even stamped with the receive frequency (146.94 Mhz.)!

These crystals are in the vicinity of 15-16 Mhz fundamental. I oscillate them third overtone at 45-48 Mhz just like RS does in their older pager radios no longer manufactured but crystals are still easily available for every frequency I have ever asked for (about 30 frequencies so far). I use a transformer link off the collector tuned to that oscillator's third harmonic that gives me the first hetrodine oscillator frequency I put into the receiver mixer.

Very well, but this does not help much to optimize the antenna.
The primary concern in an optimization is to get a good radiation
pattern for the material you invest in the antenna. Of course
a good SWR is also needed, but there are many ways to get there.

>
>I already know how to build quads.....now I want to build the
>best possible quads.

Hi Brian,

Since antenna software has widely become available, VHF and UHF
Yagis have been optimized considerably. Also the NEC-2 based codes
(e.g. EZNEC) allow to determine the radiation pattern of a VHF or UHF
antenna about as accurate as professional measurements.

This will also be the best way to optimize quads, I am sure someone
has done it.

3175. Re: AM noise blanker-?possible

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-19 00:00:00 UTC
From: jackl@pinetree.microserve.com
Message-ID: <4nncc3$5f@crash.microserve.net>
Source record: 105303

maildoc@iafrica.COM (Ian Kaye) wrote:

>Most modern noise blankers work on SSB and not AM

Noise blankers for SSB work by detecting and suppressing wideband
impulse noise. Ditto for AM. I don't think there's a difference
in the circuitry; what works for one should work for the other.

73,
Jack WB3U

That assembler is for the 320c50. I have it, but it seems to need a LOT of
work. If anyone really wants it, i will put it (the zipfile) up
on my ftp :

ftp.mindspring.com /users/eganger/t320as.zip

Should be there late on sun. nite.

3178. Tube amp b+ slow ramp up ...any suggestions? Please?!

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-19 00:00:00 UTC
From: mike@sneezy.UUCP
Message-ID: <Z5y7ND2w165w@uudell.us.dell.com!sneezy>
Source record: 105306

I have to make the disclaimer here that I don't know what deleterious effects this idea might have and that I am not absolutely positutely totally sure no harm will be done. I can't forsee any harm in doing this though.

If you are going to use a tube 5AR4 rectifier, and you want the B+ to come up slowly, you might be able to bring up the filiament voltage of the 5AR4 either slowly or bring it up in two steps. This initial low filiament voltage would cause low electron emission from the 5AR4 cathode and would bring up the B+ slowly. You might get a separate 5 VAC filiament transformer and put an inrush current limiter in the primary to accomplish this.

Careful though, B+ is nasty if your body makes contact with it. Believe me! Keep your left hand in your back pocket and wear insulating shoes.

5-10 seconds low filiament shouldn't hurt the tube durning turn on because it will start from cold, but don't rely on low filiament voltage to limit the B+ for more than that. The reason is because of that old expression for power W=EI and if there is a lot of voltage drop across the tube for an extended period the excessive power dissipation and heat build-up will destroy the tube.

All the Best - Mike

Here is info about Fertik's in Philadelphia. It is from Leon Fertik's business card. Note, I suspect that the telephone number listed is his home number.

1(215)455-2121
5400 Ella Street
Phila, Pa 19120

Thur 7p-9p
Sat 9a - 3p

From Skuylkill Expressway, take US 1 North Bound. When the highway turns into a regular road, make a left turn at Rising Sun avenue. Take Rising Sun Avenue past the fire company and make an immediate left. This will get you onto Summerville. Go to the end of Sumerville. This is Ella St. You should see the warehouse a little on the right.

The directions are from the picture on the back of the business card.

My info is about 2 years old but I have confirmation that Mr. Fertik is still in business from another netter.

Yep, that's a hig-frequency rectifier diode for the meter deflection circuit.
The European replacement is an 'EA53'
The original is a 2-01C, kinda strange part number but there it is.
They vary from being expensive to impossible to find, although every once in a
while they show up for reasonable prices.

I re-logged in =
site is "evans.ee.adfa.oz.au"
and it IS a 320c30 assembler!!!!!!!!!!
(not real obvious from the docs.)
So it's _me_ that needs lots of work!
anyway, you can get it there as "/pub/micros/tms320dsk.tar.gz"
or on my FTP as before in a ZIP file "ftp.mindspring.com"
"/users/eganger/tms320as.zip"
(it is best to go DIRECTLY there from login ---
waiting for dirlist of /users is REAL boring)
My apologies to lloyd miller, author of package.

This thread got me interested in crystal radios (again), so I
did a little snooping around the web. Folks interested in crystal
sets may want to check out the Xtal Set Society home page at:

http://www.1stnet.net/~xtalset/

They have books and collections of their newsletter that contain info
on lead pencil detectors, electrolytic detectors, air coils, ferrite
coils, etc. You can fill out a questionaire on the web site and they
will send you a free copy of their newsletter, which includes a catalog
and order form. The copy I got had an article on making a crystal
headphone by growing a Rochelle Salt crystal, cutting it into pieces,
and assembling them in a cat food can (talk about serious homebrew!).
Those without web access can contact them at:

The Xtal Set Society
PO Box 3026
St. Louis, MO 63130
(314) 725-1172

Please note: I am not a member of this society, nor am I affiliated in
any way with them or their publisher. I don't own any of their books,
and thus cannot comment on their quality or accuracy.

Please reply by e-mail direct to Andy, because his site doesn't (yet) receive this newsgroup.

****

Hi,

I'm investigating the detection of high voltage arcs in RF coaxial lines and vacuum capacitors that we use in our multi-megawatt RF facility here at JET. The aim is to improve the various protection system in use on the plant.

I've heard of a reference to work done by Collins Radio during the 1960s where they were detecting vacuum capacitors arcs in high power MF/HF broadcast transmitters by using a 300kHz resonant coil system and listening to the 'splat'!

Does anyone, particularly Stateside, have any more information or recollection on this technique?

Many thanks...Andy Sibley

Yes, you need to add a series avalanche diode (usually called zener diode) of 11 V,
so that for any voltage of less than 11 V, no current flows. You then need a
resistor to limit the current to 1 mA, with the excess (11-14)=3V. So a zener
diode of 11 V in series with the meter and a 3000 Ohm resistor should do.

Completely wrong. Refraction of VHF and up signals happens all the time,
typically the bending puts the radio horizon at 4/3 the distance of the
actual horizon over a smooth earth (e.g the lake). Evaporation increases
the humidity and this increases the bending.

>curent is?

The best way I've found is to load it up and monitor the secondary voltage. When it starts to sag, you've found the saturation current. If it blows up, you've found the maximum current rating of the windings. But the only high-power high-voltage DC load I've ever found was an amp and a dummy load. ;) Alternatively, you can measure the resistance of the primary and secondary and use Ohm's law, but this is highly imperfect and takes no effects of inductance or magnetic properties into account. (Hint: use a high-impedance ohmmeter.)

I've heard of people hooking HV transformers up backwards and tying the primary to a parallel set of car headlights, monitoring that current, and adding headlights until they hit saturation. A headlight burns at about 100 watts (~8 amps at 12 v).

Rule of thumb: size of a six-pack = 500 watts, size of a 12-pack = 1500 watts, too heavy to lift = 3000+ watts.

For SSB, you can get away with a remarkably small amount of iron to get a decent power level. CW, FM, and RTTY require more iron. A lot more. For dependable service and long life, you might consider getting a transformer that is marked for its ouput current. (Yeah, Peter Dahl charges an arm and a leg.)

MFJ has a 10 watt transceiver. Saw them at Dayton. Is frequency limited from 50.000 through 50.300 MHz. No fancy gadgets such as memories or digital readout. Looks a lot like their other single band rigs. One vendor had them for 199.99. CW is an option board.

Hi Isaac, I think that you can most of the data on these parts right off the www. I haven't taken the time to look them up myself, but most of the major manufacturers have web pages with data sheets available.

For the LM... parts try "www.nsc.com" for National Semi

For the NE... parts try "www.semiconductor.philips.com" for Philips

The transistors are probably avail from Motorola at "http://design-net.com"

Hi all,
A friend of mine has just bought a Yaesu FT480. It has an output power of 10 Watts and he wants to use it to drive a transverter to operate on 6 meters.
The problem is that the max drive for the transverter is 5 Watts. He will need to put a 3 dB attenuator in the output of the radio to drop the power to 5 W.

I have found info on what values of resistors to use to make the attenuator, but what I would like to know is would EACH resistor need to be able to dissipate 5 Watts of power?

Any help/info to scott@demon.co.uk

>
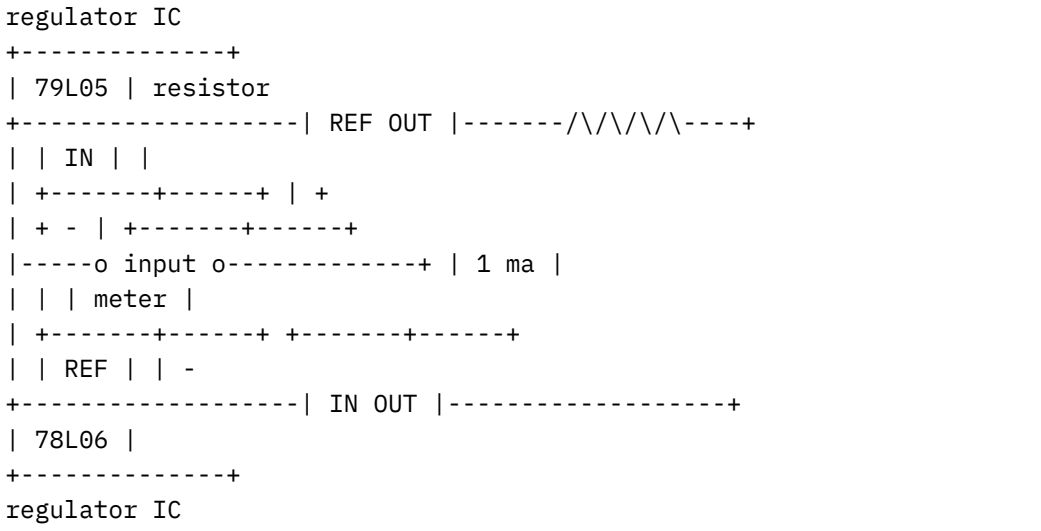
> Thanks, John AA9QP
> lumkes@cae.wisc.edu

This expanded scale voltmeter doesn't require trimpots to
obtain useable accuracy or require the tedious selection of
zener diodes. This circuit consists of only three parts in
addition to your ammeter. This circuit is completely linear
and allows use of the mechanical zeroing of the meter. The
resistor is selected so that the value of the resistor plus
the resistance of the meter coil is equal to 3000 ohms
(14-11/.001). If the resistance of the meter coil is unknown,
put a 5Kohm trimpot in place of the resistor and adjust for full scale
deflection with 14 volts applied. If the voltage being
measured falls below 11 volts the output to the meter changes
polarity. Keep in mind that this circuit will present a 3 to
5 mA load to the voltage being measured.



For use with other voltages. select regulator ICs for sums
equaling the lowest voltage to be displayed (6+5=11 volts in
this case).

This circuit is taylored from the Jan 20, 1994 issue of EDN magazine,
page 73.

Scott-

****
********** ** Desired Attenuation = 3.0 dB
CW Power Input = 40.0 dBm **
System Impedance = 50 Resistance Dissipated Pwr Use (minimum)

```
-------+----R2-----+------ R1 292.4 32.3 dBm 4-5 watts
| | R2 17.6 33.8 dBm 5 watts
in R1 R3 out R3 292.4 29.3 dBm 2 watts
| |
-------+-----------+-------
```

** **

These are the calculated dissapation values for a 3 dB PI pad
with 10watts (+40dBm) drive. You need to provide a comfortable safety
margin so you don't cook the resistors. Since the input shunt resistor will
dissipate almost 2 watts use a 4 or 5 watt part there. The series
resistor will dissipate almost 2.5 watts so use about a 5 watt part
there. The output shunt resistor will dissipate almost 1 watt so use
ar least a 2 watt part there.

Hope that helps out.

I always thought that in inductors, it is the current that generates
the flux. As opposed to capacitors, where the voltage across the
electrodes is responsible for the electric field.

Although the MFJ piece is a nice VSWR meter, aside from helping adjust for a 1:1 match, it does nothing for optimization. Field optimization is a long painstaking procedure requiring a proper range, test antenna, source and acurrate calibrated (in dB) receiver. In addition, unless the range is a slant range your efforts may be in vain.
Bob Haviland's (sp?) quad handbook is an excellent starting point. Beyond that Brian Beezley's Antenna Optimizer will allow you to "build 1000's of quads in minutes using gain, F/B and VSWR for optimization goals. Start w/ the book then enter the models into the program.

Microwave at Dayton - definitely on the rise, and I don't mean the DSS
cheater cards, I mean real hardware. For example, one surplus dealer
had pulled an entire set of Narda directional couplers, and was
selling them for only $25.00 each! These were pulled out of almost new
equipment. He had a complete set - 1-2, 2-4, 4-8, 8-18 GHz, and had
10, 20, and 30 dB couplers in each range. These couplers looked brand
new! I sell microwave components for a living, and almost bought the
entire set from him for resale, but didn't because I only sell new
components.

In the old days, we use to speak of 1296 EME with hushed tones, as it
was some sort of black magic and was very expensive to get into. Lots
of experimentation at 10GHz and up these days. Gunnplexers were
selling like hotcakes.

in a nutshell...

The variables used by the Amidon formula to calculate flux density
are the applied AC voltage, frequency, cross-sectional area of the
core and the number of turns. There are also two constants. I can
only assume that the constants eliminate the need to calculate
current flow separately. The formula is structured in such a way
that flux density is directy proportional to the applied votage,
but inversely proportional to the other three variables.

The formula is: Flux Density = (Epk x 10^2)/(4.44 x Ae x N x f),
where:
Epk = applied peak RMS volts
Ae = cross-sectional area (cm^2)
N = number of turns
f = frequency (MHz)

According to Amidon, this is applicable to both ferrite and iron
powder cores.

Message-ID: <4nvb2b$7at@n0jcf.com>
Source record: 105247
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

One of my Dayton souvenirs was a Kinemetrics True Time Division
Model 468-DC GOES satellite timecode receiver. I'm looking
for any information on this beast... particularly what sort
of antenna was connected to it. It appears that it might have
been some kind of active antenna that could have had an integral
downconverter.

GOES timecode is transmitted on either 468.8250 from GOES/West
or 468.8375 from GOES/East. The front panel of the receiver
has LEDs to indicate which satellite it is receiving.

The unit also has an RS232 serial port on the back which can
output the timecode to some connected serial device.

So, if anyone has any info-- schematics, user manual, command
set for the serial port, etc. I would be very interested in
hearing from you.

Thanks.

That is true Wilbert, but current relates to voltage and impedance. In some cases voltage is easier to use, in some cases current is easier to use.

The problem is either related to parallel reactance and voltage, or the current. In any case, it eventually gets down to the flux density and losses.

Load current has nothing to do with "saturation". Saturation is caused when the flux density of the core reaches its limit. It is measured by monitoring the excitation current of the primary as primary voltage (and flux density) are increased with an UNLOADED secondary. At some point the current will sharply increase, that is the point of core saturation. Operating the transformer just below this point generally provides maximum performance per pound of weight.

Ignoring the inconsequentially small core excitation losses in a well designed transformer, power loss and voltage drop is a linear function. If a properly designed transformer is operated at twice the secondary current, the heat generated (ignoring the small excitation current) and voltage drop will exactly double.

There is no such thing as secondary "current saturation" in a conventional
transformer,
losses and voltage drop increases linearly until the secondary is completely shorted or the transformer is destroyed.

The correct way to calculate the power capability is to know the core material and core size, the TOTAL resistive losses, and temperature ratings of the materials. You can approximate this from the weight and style of the core and the AC resistance calculated by loading the transformer (even with a light load) and measuring the ESR (equivalent series resistance) of the transformer.

Handbooks may help with the details of this. But if it was my transforer, I'd just look at the style and weight and compare it to other commercial designs. If it looked close, I'd just try it and see if the thing worked OK.

>year after my umpteenth attempt to build one failed. Now I read about
>chemical detectors and you got me started thinking about winding wire
>and scrounging for earphones.
>
>I'm a chemist by training and the idea of a 'solution' detector really
>intrigues me. Any idea where I could find more information???
>
>Rod

I'm virtually certain that the acid used was nitric; that a small gage
Pt wire was used to barely touch the surface (when it did touch, the
wire curled up). Whether surface tension of the acid (molality unknown)
played a part I don't know. I was STRONGLY discouraged by my parents
from messing with nitric acid....Can't remember the book I read this
in, but it was ancient when I read it.

3223. Needed: FM stereo multiplex ICs

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-22 00:00:00 UTC
From: mfick@engrs.unl.edu
Message-ID: <4nvj4r$7js@crcnis3.unl.edu>

Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.shortwave

As stated in the subject, I need to get my hands on a couple of stereo FM multiplexor chips (and their appropriate demultiplexor IC). Additional requirement: must be cheap, as these are for weather balloons that I will probably never see again after launch.

Please email me with any ideas on where I can get these chips.

Ron, I'd be interested in any info you've gotten on your phone. I've often tryed to extend the range of my cordless phone by adding a longer antenna to the phone, or hooking the base up to my CB antenna on the roof(probably not very low SWR). But not much luck. I wondered if the phone may be opened up and the wattage increased. Any suggestions?

: This circuit is taylored from the Jan 20, 1994 issue of EDN magazine,
: page 73.

(Sorry for echoing nearly the whole posting, but it's important for
context...)

I recall seeing this ckt in EDN, and had a problem with it at the time.
It _may_ work, but it operates the regulators outside their rated
specifications. Specifically, the 79L05 will be trying to hold its OUT
at 5 volts below the (+) input, and the 78L06 will be trying to hold its

OUT at 6 volts above the (-) input. So when the input exceeds 11 volts, the 79L05 out will be more positive than the 78L06 out, and you will, supposedly, get current _out_ of the 79L05 and _into_ the 78L06. This current direction is opposite to what these parts would be delivering when used normally. If you check the spec sheets, for example from National Semiconductor, you will see they are spec'd for operation only above 1mA in the forward direction. I actually questioned Bob Pease on operating these parts below that rated current, and received a hand-written reply that said, "don't." (Or at least don't expect them to always work that way.)

It is possible to modify it to run the regulators as their spec sheets suggest, by dropping resistors from each regulator OUT to its respective REF terminal, but if you do that, the meter won't stay at (or very near) zero below 11 volts input.

Seems to me a 5% zener operated as its intended to be is better than the 4% tolerance regulators operated improperly. And the adjustable shunt regulator is even better, allowing a condensed 0-11 volt section below the expanded 11-14 volt section on the meter scale.

RE: Dayton,
Just talked to a friend who works for a retrailer set up inside (who had MULTIPLE booths with multiple tables.) He said receipts were down 60% from last year, and last year they were down 40% from the years before. Attendance seemed down- despite claims of "30,000 attendees", the aisles were not full, and only the period from 11AM sat thru 2PM sat was anywhere near busy.

Some smaller one-booth retailers were folding up early sunday AM. Conversations with other longtime vendors indicated their receipts were down similarly. An interesting sidenote was that you didn't see people walking around with big boxes with brand-new radios in them... unlike other years in the past.

My friend has been attending Dayton regularly as a ham and working with a vendor for at least 15 years, so he's seen enough to have a good frame of reference.

For the last several years the ARRL Handbook has published a 6m
transmitting converter, which uses an MRF476 final and puts out 3-4
watts on 6M.

If you're fairly new to homebrewing, you might want to try TenTec's
kit instead. I don't know much about it; others here might offer
their opinions.

Source record: 105263

For a long time I've been building a mode B satellite station. I've been sort of using a Rube Goldberg approach: HW-101 on ten meters goes to an attenuator. RF goes up to the roof where (in a metal container I have a hamtronics transverter (28 Mhz to 435 Mhz) that feed two Ramsey Electronics bricks. The transmit antenna is a homebrew eight element Quagi fed with about 15 feet of Belden 9913.

I can't seem to get a lot of RF out of the system. I have no experience above 50 Mhz and very limited test gear. I have lots of questions:

On the transverter board, there is little audio plug (female) for the UHF out. What is the recommended way to get the RF from this plug (on the board) to the connector (I have a BNC female) on the box containing the ?

Because I didn't have anything else available, I used lengths of 9913 and (gasp!) ordinary UHF connectors to tie the transverter and the two brick together. I know that these connectors are very lossy at UHF - Would the losses be enough to cause my low RF out problem?

It is difficult for me to measure RF out, so I've been keeping an eye on DC current to the system on the roof. Judging by the increase in current when I go "key down" with the HW-101, I'm only getting a few watts out.

Any ideas/suggestions? I realize the system is far from optimal, but I just want to make a few Oscar 13 contacts before it crashes.

Thanks 73 Bill N2CQR/HI8

How about some the kits that MCM has? Use one of the low power (1/4 mi?)
FM transmitters and some sort of oscillator in place of the microphone.
All this would run off of a single nine volt and you'd have your cat
tracking system for about fifteen bucks. It comes out as something like
a Mr. Microphone that's beeping all the time.

Now a decent DF antenna for the receiver is a different matter...

Good Luck,

>Jack WB3U
>

Just to show there is no magic here, Faraday's law in SI is

Curl E = -dB/dt.

For a single frequency f this says

|Vpeak(Volts)| N = |Bpeak(Tesla)| 2 pi f(Hz) Area(meter^2)

Sticking in the conversion factors

10^6 Hz per MHz
10^4 cm^2 per meter^2
10^4 Gauss per Tesla
Vpeak = sqrt(2) Vrms = sqrt(2) Epk

Bpeak(Gauss) = 10^2 Epk/(Ae(cm^2) N f(MHz) 2 pi/sqrt(2))
and evaluating 2 pi/sqrt(2) = 4.44... which gives the Amidon formula
quoted by Jack above.

The only approximations are that the flux density is constant across
the area of the core, and that only a single frequency is present. It
therefore should work for all materials.

Note that the correct SI unit of flux density is a Tesla. Gauss are the units of flux density in the gaussian system preferred by physicists (the gaussian system also uses centimeters as the unit of length and capacitance). I am surprised that gaussian units have slipped into an engineering application.

3254. Help With HP-432A Power Meter

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-24 00:00:00 UTC
From: daveb@buffnet.net
Message-ID: <4o2rj2$ee@buffnet2.buffnet.net>
Source record: 105182

Greetings,

At Dayton I found a pristeen 432A power meter. Something I believe will be very usefullon the bench. Owner said it works perfectly. Well I think you know the story by now. It doesn't. I did not get the manual with it so I'm hoping someone who knows this instrument can help.

When it powers up the analog display swings full scale then returns below the zero mark. If I remove the bolometer it returns to the zero on the display. Applying power to the head causes no response (-30 - 10dbm). I suspect the head is damaged. Is that the way this instrument behaves when the bolometer gets fried ?

PS: Anybody have a good bolometer for sale ? (please don't rip me off)

Thanks

daveb

Dear Floyd and QNET SysAdmins:

We have been having problems on the various sci.electronics and
related groups with Floyd here acting as though someone is wasting his
bandwidth and newsfeed talking about the Parallax BASIC STAMP
microcontroller, a perfectly normal topic for this group. We suspect
he might be a few bricks shy of a load in this respect. I even suspect
he thinks people are interjecting about "stamp collecting", i.e.,
philately!! The BASIC STAMP is a Microchip PIC-based Microcontroller,
and is appropriate for ALL the groups in HIS newsgroup line we keep
seeing! They are used by roboticists, amateur radio enthusiasts, and
all electronics technology for simple controllers!! We are TOTALLY
puzzled by his near psychotic ramblings and protests, and we ask you
to have a talk with the fellow to see if he is "assembled properly"!
Thanks a bunch, and have a nice day, you guys!
-Steve Walz rstevew@armory.com
P.S. L.O.S.A. is a mail list for stamp application technical notes,
and it is considered quite kosher to post in this neighborhood of the
UseNet.

3263. PA screen regulator plans

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-24 00:00:00 UTC
From: "Ian White, G3SEK" <G3SEK@ifwtech.demon.co.uk>
Message-ID: <$np1RHAtIVpxEwgO@ifwtech.demon.co.uk>
Source record: 105191

Full notes, schematics and a PC layout for my upgraded G4JZQ PA screen regulator are now available via W6/PA0ZN's Web pages (http://www.nitehawk.com/rasmit/ws1_1.html - tnx Rein!).

The regulator is suitable for most kinds of tetrodes including 4CX250B/1000/1500, YL1050/52/56 etc. Output voltages can be configured to anything between about 300 and at least 600V. Voltage is regulated to a few hundred millivolts, for currents of at least +/- 50mA (configurable). Excess positive or negative screen current causes the amplifier to trip into a standby state until manually reset.

Upgrades from the basic MOSFET regulator in the DX Book include an overcurrent trip and current metering facilities (all inside the voltage regulating loop), basic T/R control and provision for positive/ negative/floating ground. The whole thing fits on half a Eurocard (about 4 x 5in).

Files available include schematics and PC layout in HPGL plotter format and as LaserJet printer files, and text in Word for Windows and ASCII. Download whatever you can read.

I'd greatly appreciate some user feedback!

In the US we generally have the option of either "metered" service where
any local calls beyond a certain amount (2 hours here) per month are
charged extra or unlimited local which has a higher base rate but beyond
about 3 or so hours is cheaper than metered. Anyone who uses a modem
usually has unlimited service.

Looking for the schematic (or even better the manual) for an HP6220B
DC power supply. It's a 0-50V, .5A / 0-25V, 1A bench top supply.
It was a "good deal" at Dayton... it makes output, which is adjustable,
however the metering circuit is bonkers. The meter swings wildly from
the negative peg to the positive peg in both voltage or current modes.

I'll reimburse for any duplicating/mailing costs.

Thanks.

NO, i pay a local IPS $21.95 a month for a 100 hours, and that's all i
pay,AT&t or MCI will give you unlimited time for $19.95 a month if they are
your long distance provider-- they say your local company may charge you,
but i don't see a local telephone company charging for use of an 800
number, However some people have a limit on the number of message units per
month they can use and this involes time as well, so they could run into
extra charges on their bill. so far i have not seen any on mine.i had AOL
when i started out and dumped them when i found the local IPS, Some people
in the L.A. area get it for a low as $14.00 per month.this is for the USA
and your setup would be different, but you would need to look at all the
ways you can buy the service from your telephone company(i know you only
have one)and no choice!.

Discussions of L.O.S.A. weren't the cause of all this. It was
the (long) FAQ that brought out the flamer.

>P.S. L.O.S.A. is a mail list for stamp application technical notes,
>and it is considered quite kosher to post in this neighborhood of
>the UseNet.

The subject matter is appropriate, but there have been discussions
in the past about long posts on the Rec.Radio.Amateur newsgroups.
Because many people seem to subsscribe to these through a mailing
list, and because not everyone has a local ISP (or unlimited free
time), it was generally agreed that long files should be reserved
for FTP or Web sites. That's one reason UUE schematics and other
binaries also aren't posted to these groups.

None of this affects me personally and I certainly don't agree with
the flamer's methods. I just want to point out that it was the
length of the file, not the suitability of the topic, that initiated
this discussion. It should also be noted that of the favorable
letters the L.O.S.A. FAQ author received, most did not address this
issue. Rather, they merely stated the readers' interest in Stamps.

I think it's interesting that all of these letters, favorable or
not, were posted to USENET without permission of the various authors.
Perhaps the person posting this FAQ has a reason to do so that goes
beyond the interest of the groups?

73,
Jack WB3U

Dave, I have a 431, not a 432, but before you leap, do a little more looking. First step might be to find someone with a similar unit and swap cables and heads to see if you can isolate the problem. Might be the cable or internal to the 432.

Second, get a manual. I was able to get a manual for my 431 for about $20 from Manual Plus in Washington state. (206)531-8031. There are several other good sources for test equipment manuals, but this is the one that I've used the most (its close to me).

From: mack@mails.imed.COM
Message-ID: <9604248329.AA832981975@mails.imed.com>
Source record: 105199

I have been doing a lot of reading lately and many transformers
including DBM transformers specify trifilar windings. Why is this?

Is it just easier to do the windings? It sure doesn't seem so to me.
I can't believe that the coupling is really that much tighter when
trifilar windings are used. It would seem that the toroid properties
give most of the coupling. But I've been wrong before once or twice.

: I have been doing a lot of reading lately and many transformers
: including DBM transformers specify trifilar windings. Why is this?

Hi Ray, to get consistant, predictable results from transmission line transformers, the windings must maintain a certain characteristic impedance. In other words, the characteristic impedance of the windings appears in the equations. Bifilar and trifilar windings allow us to calculate the characteristic impedance fairly closely.

Try RT Systems in Huntsville, Al (205) 882-9292 open Saturdays till 2:00pm. Collins Mechanical filters are now being sold thru Yeasu for the FT-100MP and FT 900CAT should work for you.

>
> Hugues Caron Hi Hugues,

C0G is similar to an NP0 rating, which means (idealy) that the
capacitance does not change over temperature. Most C0Gs I have used change a

bit, but nothing like a "plain vanilla" ceramic.
C0Gs and NP0s are generally used in oscillator circuits, and while I have not seen the article you mention, I suspect these caps are in some kind of osc.
If you use any old ceramic you may have a serious drift problem. Digi-Key in Thief River Falls MN. has a nice line of monolithic ceramic C0Gs.
Hope this helps.

I'm in need of some carbon comp resistors; 2.2K and 2.7K ohm, 2 watts, around 200 pcs for a project.
Checking normal channels resulted in (when laughter quit) six month lead time estimated.
I'll buy odds and ends so long as their leads aren't cut. Old Stackpoles, Allen-Bradley, etc.
Email if you can help.
Thanks!

No. assume:

```
-------------R2---------
| |
10W R1 R3 5 W out.
| |
------------------------
```

Do this:
1) Find R1, R2 and R3 (R1=R3)
2) Calculate the voltage that gives 10W across 50 Ohm. This is V=sqrt(PR)=22.4V.
So there's 22.4V across R1, so R1 dissipates 22.4^2/R1
3) Do the same for R3, but it will have V=sqrt(5*50)=15.8V across it.
4) R2 dissipates 5-dissipation in R1 - dissipation in R3.

Well, anyway it seems I may have mis-attributed my post in this
regard, though I had thought I looked carefully, but in any case:

While some or even many radio amateurs are still in the analog dark
ages sending postcards to each other, packet radio and other digital
advances have arrived, and I know of two radio buffs myself, and THEY
use microcontrollers for their own equipment, so then, what in the
world do YOU mean by saying that a PIC STAMP list of applications is
non-relevant to amateur radio??? THEY seem to think it is QUITE
apropos, and even though I only KNOW these TWO amateurs well enough to
know, I somehow doubt that THEY wouldn't have a sense for the breadth
of that endeavor and the attitudes of OTHER folks involved in it!

So either explain your position now, or else come off of it and admit
that whoever is SPAMING the L.O.S.A posts is just a backwards
head-up-the ass son of a bitch technologically, and some kind of
vacuum loving analog throwback!! ;-) Of course I doubt you will, but
people telling the honest truth on the Net seems a bit rare anyway,
and I think you can agree about that!! ;->

And I just wished to say sorry to Floyd once again, as I went blank or
somesuch and totally mis-attributed the more strident SPAM to him, and
I have also done so in email. I am simply puzzled why people are not

availing themselves of all the local ISP's who almost invariably offer
unlimited untimed access for under $20.00 a month! Many are only $15 !!
Some associated with geek houses are honor system donations sorts
of affairs and cost little to join! There are more and more small
domains created everyday for this purpose! Just ask around and don't
let the big guys make you think they're the only show in town!

Jason:

Analog Devices has many distributor's that handle these parts. My Future Active Industrial rep said list was around $28, although pricing to ligitmate accounts could drop to $7-10 in small production quantities. I've seen this to be the case with some of the other AD parts I've designed in.

1-2 samples are free if you can show a ligit production potential, otherwise you'll be stuck paying list to one of the distributors.

Here's a few of the AD distributors, many will accept credit card orders.

Eagle 800-437-1645
Bell 800-525-6666
Newark 800-281-4320
Pioneer 800-482-0119
America 2 800-SOS-AMERICA
ADC 800-733-1230
HarborTech 800-437-4020
Major 800-966-2345
Accurate 800-753-0880
BlueFin 800-494-2583
Classic 310-539-5500

There are more but that should get you going.

The full p/n for the 0-70deg part is AD7008JP50. There is also an eval kit available with software p/n AD7008/PCB.

Good Luck,

Greetings,

Has anyone built the Ramsey 2 Meter Kit and still have the Schematics/
Parts List still around? I just picked one up at a Hamfest for dirt
cheap so it's worth it for me to try and repair it. One component is
fried beyond recognition, hence my need for the schematic/list.

I'd really like to fix this rig. The exact part number of this rig is
either RK-FX146 or RK-FX220. I'm sure the cicuitry is close enough
for either part number.

Thanks.

Brian

NO one can tell from the name "homebrew" or "misc" whether the
"homebrew" people are making radios with lemons and scrap metals of
different valences and coconut shells and thigh-rolled wire drawn
on a home-forge and insulated with tarred cloth and Galena detectors,
and is religiously offended by the mere SIGHT of a microcontroller,
OR, whether the homebrew group just builds their own equipment and
LIKES microcontrollers real much and it's REALLY the "misc"ellaneous
people who ONLY *BUY* radios and *NEVER* fix or modify them and don't
EVER wish to be bothered with "hardware problems or technology" or
especially those damned impossible difficult BASIC Stamps!!!!!!
Do you get the picture now?? I have had conflicting email on WHAT
these groups want from their own fucking MEMBERS!!!!

I'm not going to waste *MY* time reading the other people's 14,000
other overly-verbose charters on Usenet to solve YOUR problem!! You can
FUCK yourself! YOU *MIGHT* have TRIED to explain all that in three sentences
that would have solved this days ago, had you not been a knee-biting
asshole! But you elected to play one-ups-man-ship instead!! Either
inform people when you speak, or come blow me, you moron!!!

I have read every word on every post I ever posted TO!! I read your trivia, and I note AGAIN that you declined to explain to anyone else, supposing we would all go out and waste out time reading your fucking charter!! YOU didn't even POST your fucking precious charter, if you thought it needed dissemination!! You didn't even QUOTE from either of them by way of explanation!! You JUST wanted to generate your twisted antagonisms on a bunch of other groups where you thought you were welcome!! Guess again, you loose-rectumed little fart!

What are *WE* gonna do?? What're YOU gonna do you stupid haoli!!
You can kiss my ass and call me Mama for all *I* care about you!!
Shit in your hand and lick it, bastard!!! Go suck a turd!!
Have a nice day,
-Steve

*>the radio telescope?
*>
*>Dale WA2YPY

A few folks have suggested this instrument. If I can find one I'll be interested. I will probably build the old circuit in the ARRL handbooks of the 70's, the grid dipper with the 6CW6 nuvistor.

Others have suggested the "Slipper Dipper" from later versions of the ARRL handbooks - but noone said they BUILT and used one! I've considered it, but the Grid Dipper will be more sensitive. Some have said "why vacuum tubes?" Well, it's no bother to use one here! Nuvistors are small, low power anyway. A six-volt transformer with two 110 windings (110/220) will provide the extra 110 winding for the "high voltage" DC of 100 volts or so. And noone has offerred an alternative device that has less than 1pf (one picofarad) of input capacitance as does the grid of the 6CW4. And, I've easily bought NEW tubes for $4 each. (Could use some sockets, however!)

I may have my ham colleague build it, as he seems interested and has more RF experience than I. I'll post progress reports. Thanks!

Source record: 105134

It is somewhat normal for the meter to behave in this manner. There is a screwdriver adjustment on the instrument front panel which is a zeroing adjustment. Try this. If you still can't zero our the error, the balometer head is probably bad. This is sometimes quite a touchy adjustment and interactr with the knob on the front panel. Turn the potentiometer slowly. It is also normal for this instrument to "drift" zero adjustment as the balometer heats and cools. That was one of the problems with the old balometer method of measuring power. Yes, there is a ham in Denver area who has access to inexpensive balometer and diode mounts (I bought one for $25.00 at a recent swapmeet). However, I recently packed all that away. Wish I could help more.

I use the old "Plumbers Special" P-P 4CX250 design of several decades ago on 2-meters. I might comment that when the amplifier is operating properly, the screen produces a little negative current - "charges" my Zener screen regulators. This is normal for this tube and is indigative of good linear operation - not more that a few mills, however. If the tubes aren't loaded heavily enough - likely nonlinear operation - they will "draw" screen current. Also an indication of light loading.

I have several HV transformers from various pieces of surplus equipment I have collected over the years. When I decided to do something about the wimpy power supplies in my Heath HF amplifiers, I was faced with your problem. To make a long story short, I bought - surplus - six 1 kohm/250-watt resistors for $2.50 each. This gives you enough options to series/parallel to get an idea of where the AC voltage starts to slump, and, therefore, how much current each transformer is good for in a bridge circuit for a HV supply. If you want more dissipation, you can fan-cool the resistors, or get fancy and put them in oil. Of course, you must also build a resistive divider to properly read the HV rms transformer secondary voltage. This is just ohms law - 2-watt resistors work fine if your loop current isn't too high and your duty cycle isn't too long. It only takes a few seconds to make an accurate reading. I eventually developed v/i curves for all my transformers and eventually bought a 3-amp CCS unit fron Peter Dahl for the SB-220 (it WILL do well over 2 kW output with a good power supply!). The little single-tube - 8873 - SB230 will also put out the legal limit on all bands in a linear, no flat topping or gain compression, fashion with a good stiff supply! Good luck>

I was not involved with Collins Radio experiments you are referring to. However, I have done much work with RF and HV. I will assume you are producing coherent RF - i.e. of single frequency as we do in amateur radio or broadcasting. When an arc is produced in such a system, much non-coherent RF energy is also produced by the arc itself. I had an SB230 from Heath with a stiff HV power supply feeding it. Heath did not design the amp with any parasitic surpressors in the plate. While operating into a good dummy load the amp would occassionally produce this "beautiful" arc around the BeO element from the plate to ground. The frequency was centered around 45 MHz, but could be heard everywhere in the RF spectrum from LF to UHF and above. I curred the problem by introducing a parasitic surpressor into the plate lead - a loss element above 40 MHz. No more RF arcs and no more wideband RF noise. I suspect you can use the same technique for detecting HV RF arcs in your system. I also suspect this is the same system refered to in the Collins experiments. I hope this helps. Just look for widebband "nasty" sounding RF energy where you should have clean and coherent energy.

I believe, but could also be wrong, that trifillar vs. befillar windings yield lower Q and broader bandwidth. If you consult the ARRL publication on the subject, this seems to be one of the conclusions of all the wonderful data presented in the publication.

Just posted a JPG picture file (in uuencoded form) in the newsgroups alt.binaries.pictures.misc and alt.binaries.pictures.12hr

The picture shows several "pencil" sub-mini tubes, along with a pair of regular mini tubes (one a 6AK5) for size comparison. Most are filament tubes by Rayethon, and 3 of the really skinny ones are detector diodes (with heaters).

These sub-mini tubes (along with compactrons) probably would have been the next wave of tubes to hit the consumer electronics area, if transistors were not developed. Imagine an audio pre-amp made with pencil tubes.

Also posted a picture of 25 to 30 year old radios.

Its available from Newark via mail order. I just recently bought one along with two Analog Devices AD600's. Price was ~$55.00 for AD7008JP50 -thats 50mhz model. They will ship COD or VISA/MC. Mine went into a DDS/PLL hybrid interpolation synthesizer for my homebrew receiver.

All I need to do now is to obtain development system and C language for PIC controllers, yuck. Its not much fun tuning the radio with dipswitches!!

3311. What kind of antenna is this?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-26 00:00:00 UTC
From: hturn@pelican.davlin.net
Message-ID: <31a81e0a.23859155@news.davlin.net>
Source record: 105225

I have just aquired a military antenna and I was wondering what
exactly I have. It seems to be a very large mobile antenna.

It consists of the bottom (base) which is about 24 inches long and 3
inches in diameter painted green. N type connecter on the side about
9 inches from the bottom. Stamped on the base is the following:

ANTENNA AT-1062/G
ORDER NO. 40512-PM-60
MOTOROLA INC. SER.NO. 1

Yes ser.no. 1.

After the base is a very heavy steel spring. Then comes 24 inches of
half inch aluminum tube on the end of which is a compression nut where
a whip such as a 102 incher would fit.

Any ideas as to what I have aquired?

Does the N type connector indicate that this is a VHF or UHF antenna?

Let me know if you have any ideas I am tempted to disasemble the base
but don't dare to now.

Thanks Hank.

Hi

Wonder if anybody can identify this PA unit which I've been offered?

It contains 4*4 identical "bricks", all combined at input and output.
Each brick is about 4.5 x 2.75 x 1in and contains two power transistors
ACIRAN 45008 in push-pull with forward bias circuitry.

The main chassis is H section half inch thick ali, with an oil cooling
element on the middle web and four bricks on each wing. It also contains
a 200v 400 Hz fan. The whole thing weighs about 100lb.

Any ideas, please, either about the transistors (Vcc, gain, Po etc) or
the whole unit?

We've added a directory of Amateur Radio Equipment specification datasheets to the Ham Radio Online web site at:
http://www.accessone.com/~vbook/hronline.htm

This directory is a large list of pointers to detailed specifications for all new Amateur Radio gear being manufactured today. If you are in the market and looking for just the right radio for you, take a look - this will help you narrow down the choices for the radios that meet your requirements.

Ham Radio Online is self-supported (no ads) and just happens to be the coolest, award winning Amateur Radio web site that looks like a magazine. We feature original stories, newsletters from around the world, in depth real-time propagation, auroral and meteor scatter reports, real-time disaster conditions and much more. Stop on by and have a visit. Let us know if you have ideas for other Amateur radio related items that we should add to our web site.

Hello OMs,

I am looking for TFWIN.DLL. This is host mode packet driver for Windows 95.
My neighbour is running WinFBB PBBS with BayCom modem, its documents
remind this library, but we cannot locate where it is.

Any informations are welcome.

Am I correct in assuming |Vpeak| is in fact the voltage induced by the
B field?

It appears to me that the voltage applied would have to be slightly
larger than the opposing (self) induced voltage, this in order to
generate the current responsible for the H field.

Ten-tec offers a couple of 6M transverter kits...6M to 20M or 6M to 2M.
DownEast Microwave also offers a 6M transverter kit..can't recall what
the I.F. is but I believe its 10M.
The DownEast unit is of superior quality and design but the Ten-tec kits
are much more affordable. I bought one of the 6M to 20M kits about a year
ago...it went together easily and performed very well. I was impressed
with the value:performance and would recommend it !
You would be hardpressed trying to source the parts and assemble something
on your own for less than $95.

Conventional transformers, even wound on toroidal cores, give very
limited bandwidth. Bifilar and trifilar windings act as transmission
lines, which give very high bandwidths. Transmission line transformers
need the core mainly for low-frequency performance.

: Wilbert, ZL2BSJ.

First let me slightly correct the formula; the N should be
on the opposite side of the equal sign. N*A gives the total area
enclosed by the N turns,
|Vpeak(Volts)| = N |Bpeak(Tesla)| 2 pi f(Hz) Area(meter^2).
The rest was correct.

V_peak is the voltage measured across the N turns. If the N turns are
left open, they don't contribute to the the magnetic field since no
current flows. You then measure the voltage induced by the magnetic
field from whatever other turns there are. If you apply a different
voltage to the N turn winding, a current will flow in it. This will
produce the additional magnetic field exactly needed so that faraday's
law holds. That is there is some (self) inductance in the winding and
current through the winding itself will produce an additional voltage
across the winding. For example if you short a turn, the net flux
through the shorted turn must be zero (ignoring the fact that it is not
a perfect conductor). If other windings on the toroid produce a
magnetic field, then a current flows in the shorted turn to produce an
additional field that cancels the field from the other windings through
the shorted turn.

You can calculate the flux from the currents in the windings too,
but it is a little harder. The other Curl equation
in Maxwell's equations (in SI) says,
Curl H = dD/dt + J.
For normal toroids, the dD/dt term can be ignored, and this reduces
to Ampere's law
Curl H = J.
Converting into the integral form, I get (approximately) for a single winding
H 2 pi r = N I.

or with B = mu H
B = mu N I /(2 pi r)
where 2 pi r is the circumference of the loop around the toroid where you are calculating the magnetic field (it really isn't constant across the area of the cross section of the toroid). You can now measure all the currents in all the windings complete with their phases and calculate the flux from each of the windings. You need to know the mu of the core too. You then add all these fluxes up to get the total flux in the core.

The answer you get will agree with that of Faraday's law. Most people find it a lot easier to just measure the voltage across one winding.

Hi,

This isn't really Ham type stuff, but I couldn't think of another appropriate newsgroup to post in.

I have a 1963 VW bug with the original radio in it, and I'd like to leave it unadulterated, ie. keep the Motorola AM radio. So, what I was thinking is make some device that would allow me to say have an RCA stereo jack on one end and that plugs into a tape player, 2 meter rig (OBHAM!), etc. While the other end eventually goes to an alligator clip that attaches to the antenna. Ala old drive in movie theaters. However, I am completely stymied as to how to build said device.

Thanks,
Adam

From: Charles Wenzel <wenzel@wenzel.com>
Message-ID: <31AA6802.2C05@wenzel.com>
Source record: 105162

There is a circuit for an AM-band transmitter in our technical library at www.wenzel.com. Although it may look complicated at first, the circuitry is easy to make work. Since you are transmitting to an older radio, any crystal frequency in the band will work. (Newer radios only tune to specific frequencies.) You shouldn't need a direct connection to your car's antenna - just a few feet of wire. You may use your tape player's "mono" mode so that you hear both channels or you may wish to build the audio mixer to combine both channels and to give a bit of signal gain (see text). Some earphone outputs require a DC path to ground in order to work properly (mine did!) so add a several hundred ohm resistor to ground (whatever works). Please let me know how it works!

Patrick,

You have a real problem. There are very few sources left of true carbon comp type resistors. Most people THINK all carbons are carbon comps, but most are carbon film types having much higher inductance and VERY poor energy absorbing characteristics.

Other than A-B, I don't know where you'll find them today. You might try Carborundum as a source of higher power resistors.

We require use of carbon comps (in RFequipment manufacturing) both for energy absorbing and low VHF impedance (parasitic suppressors), we just bite the bullet and order A-B's.

In article <832707131snz@darkblue.demon.co.uk>, Gareth Edwards
<Gareth@darkblue.demon.co.uk> writes...
>If it's what I think it is, there's a good treatment in "Solid State
>Design for the Radio Amateur" by Hayward W7ZOI and DeMaw W1FB (ARRL
>1986), which is an excellent book that everyone should own.

Careful, there... I analyzed the recommended diplexer in "Solid State Design"
using modern tools, i.e. SPICE. It has a very strange double-peaked bandpass
and input impedance. One of the more modern designs (since computer modeling -
SSD is 1970s vintage!) will give you a nice smooth 50 ohms over a very wide
bandwidth. See, for instance, the diplexer used by KH6CP in a Sep. 95 QEX
article.

Other than this and a couple of other minor nits, I wholeheartedly agree about
"Solid State Design". Almost every single time I want to learn something about
RF design, I pick up SSD and find an answer, or at least some info to get me
started. It's easily one of the most useful electronics books ever written!

The main area to watch in that book is when they start cascading filters, and
the diplexer mentioned is one of those. I've found that you can't simply plug
the output of one LC filter into the input of another and expect simple
results. Almost always there are unwanted resonances created.

Neat web page. Lots of good stuff.
But it takes forever to load... like 2 minutes when the web is loaded.
Would it be possible to put all the neat graphics in a sub-page, or at
least show the links before posting the graphics so we don't have to
wait?

I'm planning to put up a 250 ft (approx. full wave 80m) wire dipole and feed it with ladder line for use as a multiband antenna. If the legs are more than 90 degrees apart in the horizontal and veritical planes, will the radiation pattern be substantially different that if it was 180 degrees in each plane? Any other suggestions appreciated. Thanks.

From: kferguson@aquilagroup.com
Message-ID: <4ofo1g$9mt@blixen.aquilagroup.com>
Source record: 105085

OK, somebody must of thought of this before, but I had to think of it myself!

This info will be handy to anyone homebrewing a superhet, or IF filter.

I wanted to sweep the IF filter in my TS-520, but I lack a sweep generator..

First I hooked voltmeter and freq counter to audio output, and plotted point by point. Slow, but Illumintating..There was a nasty extra hump on one skirt, only ~12 dB down. Yech!

I wanted a "real-time" sweep, so I could observe effect of tweaking filter input transformer. What to do?

After thinking for a few weeks, I had it:
Connect a low frequency sawtooth wave to the variactor used for RIT shift. Using the internal calibrator as an input, the reciever now sweep tunes through the signal, allowing the filter respose to be observed directly on the scope.

The trick is in using a fixed signal, and sweeping the rx tuning....backwards from normal test setup. Using the existing RIT circuit was a frugal touch as well.

Worked great for me, should be able to adapt to any RIT equiped circuit, or a couple of diodes could be added for test.....

I triggered the scope off of sawtooth waveform, but a X-Y setup should work well too.

The triangel wave generator was homebrewed using a LM3900 Norton Amp. I set this up for DC adjustment too, so I could check liniarity (using frequency counter on AF again) linearity seemed pretty good over ~ 4 Khz range.

Now If I could just get a decent IF filter response! Looks like I need to build a ladder filter....been wanting to do that anyway.

>article.

Now you pushed one of my buttons: believe it or not, there was life before
Spice. In the 1950's, it was shown using nothing but algebra (in closed form)
that any singly terminated Butterworth filter and its dual can be combined
to make a "perfect" diplexer, where "perfect" meant that the reflection
coefficient of the "combined" port was zero at all frequencies. In 1968,
Wenzel (IEEE trans. MTT) showed that if the Butterworth filters were replaced
by elliptic function filters, the reflection coefficient, although no
longer zero, was negligible for most practical purposes. Again, this was
done without any circuit analysis programs. There is nothing "modern"
about properly designed diplexers. In fact, Spice doesn't design anything,
except by trial and error. And you can do that at your workbench without
a computer.

Thanks for letting me say that. We now return you to your regularly scheduled
program.

>
> 73 de KF4GJQ (Charlie Fortner)
oh yes, the radiating pattern can be quite different, as you increase
frequency you can wind up with a Vee beam. Its better unless you plan on putting up a
Vee beam to have as close to 180 degrees as possible, A small angle sat 15 or 20 degrees
really wont make much of a differance
but you have as a full wave antenna very high feedpoint impedance of
several thousand ohms, which can make matching hard unless you make
some pains to adjust your feedline to give you an impedance at your
tuner that you can deal with, of corse you can have problems on other bands. You should
have better luck making a closed loop of 1 wave or better on your lowest freq. you
whould find a reasonable match anywhere
you want and with a good 4-1 balun you can use your rigs internal antenna tuner and have
both an efficent antenna and one that is easy to
match. The closed loop keeps impedance excursions to a minimum and
provide good performance.

3350. Motorola Mic Pinout?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-28 00:00:00 UTC
From: eganger@mindspring.com
Message-ID: <eganger.152.030E1C4A@mindspring.com>
Source record: 105089

I recently bought some motorola DTMF microphones.

They are part # HMN1014ASPOT

They have a connector that looks like:

(looking down on connector end)
the o's are contact holes.

```
|<- 5/8" ->|
+----------+ --
| o o o | ^ 3/8" ( my pin numbers: 1 2 3
| o o | v 4 5 )
+----------+ --
```

All on a piece of semi-soft black plastic about 1/2" long.

I get continuity between pins 3 & 5 at push-to-talk.
I get about 10K (using cheap VOM) between 2&5 (5 -, 2+) on PTT.

I had it apart, and there are 3 little PC boards, double side surface mount; I do not recognize any IC part #'s to get voltage info this way.

Does any one know anything about the pin-out for this mic?
I want to use it for an old mobile 2M rig, and must replace the connector anyway!

Thanks in advance,
Ed Ganger, KB4ORA

>
>--Myron.

You can get into them by removing the bottom plate. Since there are charger tabs (holes) in the bottom, remember the orientation if you use a drop-in charger. Use an Xacto knife or other thin blade and simply loosen (around the edges, like taking a cake out of the pan) and pry the bottom plate off. Once thats done, you can sometimes pop the batteries out by using a few sharp blows or alternatively just take some needle nose pliers and yank. Sounds brutal and is, but does work. I suggest that you replace all cells if they're easily available or you will get used to doing this. Incidentally, the diode / resistor protection circuit can be trashed and the bottom may not fully seat properly - a little RTV will hold it nicely. Portable phone batteries can be found cheaply and make good replacements, often come shrink wrapped and with leads - easier than tack soldering to nicads - which does work, but not well.

Good luck! 73, George VE3YV / K8HI

3353. Here is how to solder Nicads without tabs

Newsgroup: rec.radio.amateur.homebrew

From: nv7v@burgoyne.com
Message-ID: <nv7v.64.0017B4AB@burgoyne.com>
Source record: 105092

Mike in Oregon wanted to know how to solder on nicads that did not have
a solder tab. Here is how.

Go to the plumbing supply store and get some solder paste.
The stuff I use is like a light grease. It is acid so treat is like
what it is. If you get some on your hands and scratch you'll
find out why....
It is the acid used in acid core solder. I know you aren't supposed
to use it in electronics but you gotta do what you gotta do.

Dip the end of your rosin core solder into the paste and solder away.
The fumes are nasty, don't breathe them. This works good on
corroded wires. Clean the tip of your iron on a seperate cloth so
you don't contaminate your sponge. You want to get the acid off
the tip as soon as you are done as it will eat away the tip.

I've been doing this for years and it works great.

Steve

i think these are a similar animal to what i once i had to replace in a small mobile hf amp (yaesu]. mine were an srf type for hf and they are probably a proprietory device. i phoned motorola and had no luck''they couldn't release the information. What i ended up doing is making photocopies out of a motorla data book;;taking an educated guess at what might replace them. i narrowed down the search to a few possibilities. considerations were 1) npn or pnp 2] what usually drives this amp how much power does it usually see gg into the transistor 3] match up some of the motorola data book schematics with the units schematic and find any similarities. 4) how much gain does the amp usually provide check the specs on the amp 5) how much output does the amp usually put out etc. using this kind of methodology i came up with a few good subs in the mrf series namely the mrf 454 and mrf 412 and a few others . they all would have worked fine i think but i chose the mrf 412 because it was more rugged etc. if i was gg to spend that kind of money i might as well go ahead and lay out a few more bucks for the better type. ...if you would like''i could look up some subs for you if you can perhaps mail me info. i have a big computerized data base of semiconductors at work and i can research in my spare time ..iam good in callbook as ve3ab for several yrs now. 73s es gl earl...address = earlve3ab@igs.net

3355. Help homebrewing a mobile GPS antenna (quadrifilar?)

Newsgroup: rec.radio.amateur.homebrew

Source record: 105169

Thanks for taking a few moments to read this, and maybe to respond...

I am looking to build a homebrew antenna that will function in the band used to receive GPS signals. Basically, I have an inexpensive GPS receiver that I occasionally use in my vehicle. The vehicle roof and all the other metal provides a darn good shield, so no signals are rx.

Commercial units are available (for $150!) that purport to receive these frequencies. I've seen one , and they're small round, and since I didn't own it, I couldn't crack it open to take a look see.

So if you have any advice, hints, directions, or references I could look up, I'd be most appreciative. You can either post here, or email direct to SteveP@dartmouth.edu.

If I get a good response, I'll compile the information neatly, and repost here, and place it on the WWW.

Thanks and 73s

I need to weld solder tabs onto a bunch of nicad batteries.
Thought I'd ask before I risk electrocution.

I don't have access to a proper welder, so I'd like to "make do".

I thought I'd jig up a couple of sharp pointed nails and press them against the strap up against the battery. I'll manually discharge a big cap into the nails. I have no idea how much pressure or how much energy will be required.

What's wrong with this picture? Anyone successfully welded tabs? Details please.

On a related topic, I also have a bunch of nicads with tabs for push-on connectors. I need to save some space by soldering to the tabs. Of course, they won't solder (now I know why they were cheap), probably stainless. Is there a flux for soldering stainless?

Thanks, miker

Sounds dangerous to me! I had a similar situation several years ago
and decided to try to find a low-temp way to solder the tabs on.
Radio Shack had some liquid solder in a syringe that works at a pretty
low temperature. I used it with a good hot gun (140w Weller) and so
far they are still working.

Be careful not to heat up the cells any more than you have to!

With a proper welder the energy would probably be between 20 and 80
watt-seconds. Spot welders have a short. med and long timing mode.

>I thought I'd jig up a couple of sharp pointed nails and press them
>against the strap up against the battery. I'll manually discharge a

Use copper. I would suspect that any other material you woulld weld the
"nail". I would suggest compressing the tabs between 2 copper rods, 1/8
to 1/16 diameter. Turn on power elsewhere.

> >What's wrong with this picture? Anyone successfully
welded tabs? >Details please.

All the Nicads tha I have seen don't readily solder. The tab is probably
nickel. Gold plating the nickel should allow soldering.
Gold will stick well to nickel.

From a book on Deforest, he experimented with various detectors
including alcohol (maybe even beer), (it only worked for a few
minutes),and bunsen burner type flames before inventing the triode.
I think the name may be something like Deforest: Father of radio.
Hope this helps.

>73 de KF4GJQ (Charlie Fortner)

Charlie, you don't say how high at the apex! This makes a
considerable difference too. Yes, the radiation pattern will be
different at the fundamental freq and very different at the harmonics
but if you put up such "long one" don't worry about it ...just use it
and make your observations! Good luck

that helps.
>
>Thanks & 73... Mark AA7TA

What you've got is a Motorola transistor that was a
"special". SRF's usually have a standard counterpart
(such as an MRF455 in the case of an HF power
transistor) but were house-marked for a particular
company's application due to a special requirement.
They may be graded for a certain beta range or, more
likely in your case, for having more tightly controlled
UHF parameters than a standard MRF part would have from
any given lot.

Sometimes, companies have parts specially marked just
to discourage copycats. The silly part is that
these special parts often have the Motorola "bug"
printed right on the top (although Motorola probably
won't release the actual cross reference information
for one of their customer's source control drawings).
WHat you might do is get hold of an old Motorola RF
Devices handbook and just do some detective work.

You probably know the output power and frequency range
of the device; you know or can measure the Vcc (and
double it to put you in the ballpark of the proper Vcex
ratings for a Class-C UHF power amp). THe case type is
obtainable by simple observation and comparison to
what's in the catalog.With this info, you can generally
cross-reference the device to a standard part with a
minimum amount of trouble and with a high degree of
certainty.

Hope this helps!

What method are you planning to use to drive the ladder line? A
balun will probably be less than satisfactory due to the high
impedances involved on some bands.

I hate to post when I am unsure of my understanding of these things.
But still, Can't tapered coax sections be used to match most any
impedance to any other impedance over a modestly broad bandwidth? What
I envision is something that would be say over 10 diameters long,
possibly less than 1/10th wavelength. What I have considered doing
when I get a round tuit is taking a length of the smaller center
conductor and wrapping it with a skinny triangle of metal foil to
create a taper to the larger center conductor. Over this, I would
squeeze a length of the larger dielectric molded to the shield taper.
Then I would form the larger shield to fit the taper.

Am I just blowing smoke or could this be a workable way to fabricate
coaxial matching sections???

3372. Class-C RF transistors ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-29 00:00:00 UTC
From: hduff@hcol.humberc.on.ca
Message-ID: <8333697066401@hcol.humberc.on.ca>
Source record: 105100

I've always wondered what makes an RF transistor a "Class-C" device
versus linear ? I always thought that it was the external biasing that
places a transistor in a different mode of operation yet some
transistors in the databooks are spec'ed for Class-C operation.
I suspect it has to do with the die-fab. What would happen if one of
these transistors was biased class AB for SSB use ?

Thanks...

Ted, you are on the right track, but at 144 Mhz the lengths required get slightly unreal.
However, get a copy of Jasick and Johnsons "Antenna Engineering Handbook". Look up coaxial matching sections, in particular the part about two 1/4 wl marching sections in series, where Hams generally use one. The basic idea is rather simple. Say you are matching from 50 to 100 ohms. With one 1/4 wl. transformer, you would use about a 70 Zo line for the transformer.
With two 1/4 wl. sections, the first would be about 60 ohms, and transform the 50 ohms to 70 ohms. The second would be about 83 ohms, and transform the 70 ohms to 100 ohms. Since this is a total of 1/2 wl. the whole thing turns out to be VERY broadband compared to a single section. You can see that the extention of this idea leads directly to your tapered line. This is all from memory, so go back to the textbook and check it out there.
Cheers! Ed WA5SWD

I don't know the theory, but I have been using the Class-C rated 175 MHz 2N5641 in homebrew gear for ten years on HF, 6M, and 2M, biased for A or AB on SSB, with excellent results.

Why? I got used to them in my old Signal/One CX7 (1969), where they are used that way, and I had spares on hand.

The 5642 and 5643 have higher power ratings and probably will also do well. MOT carried them for years; if they are out now, Richardson might have still them.

I've grounded the HF rig with heavy braid, direct-connected to battery with No. 10 wire, and grounded the hood, engine (2 places) and exhaust pipe to the body and/or frame. The antenna is mounted on a well-grounded plate. Everything works great, except for a noise problem I can't seem to locate. I tried an alternator filter (heavy series coil and shunt cap) that didn't do anything--so, that, along with disconnecting the antenna making it go away makes me think it's radiated noise.

I get a rushing hash (like white noise) only when the engine is under load. It is enough to wipe-out weaker stations, but not those louder ones. I throw in the clutch and it goes away, even if I then race the engine (leads me to think it's not ignition, but some sender unit--perhaps fuel injection electronics radiate only under load?).

What device or other cause might do this? I'd like some help before trial and error decoupling whatever I find under the hood <g>)

3388. Mitrek Synthesizer Conversion for 6 m Operation

Newsgroup: rec.radio.amateur.homebrew

Hi Homebrewers,

I've just finished the technical writeup describing the steps required to convert a Motorola Mitrek VHF transceiver to amateur 6 m band operation, and would like to make the information available to anyone interested in converting their own radios.

The information consists of three pages of diagrams (double sided pages), plus two document files and the controller source code files on a 3.5 in FD. Since I cannot afford to pay for postage and cost of disc, photocopying etc. to send the material to those interested, my question is: Can anyone suggest a reasonable way of posting this information on the net (anonymous ftp site?) and if so which site and how to send the information to the site administrator?

For the curious, the conversion uses a Motorola MC145170 VHF frequency synthesizer chip, switched between a transmit and a receive VCO, the lot controller by an 8031 microcontroller. The VCOs are built from converted transmit and receive channel elements. Six pre-set channels are provided (four used), selected by the original control head. Everything fits inside the transciever. Two rigs have undergone the conversion and are providing very good service on the local club's new 6 m repeater.

Your comments are appreciated.

3390. Help! 70MHz Amplifier???

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-29 00:00:00 UTC
From: Matt Bohn <bohn@unm.edu>
Message-ID: <31AC6097.503D@unm.edu>
Source record: 105118

Hello,
I am a physics graduate student and I need 200 watts at 70MHz. I have tried to build an amplifier designed for 20 MHz and it didn't work very well (yes, I did change all the tank circuits to 70 MHz). If I purchase a 6 meter amplifier, should I be able to change it to amplify at 70 MHz? Or would a it be better to buy a 6 meter kit and adjust it for 70 MHz? I do have 30 watts of 70 MHz available.

The application is to drive a pockel cell (essentially a capacitor) inside a laser cavity and I need to apply 600 volts at 70MHz. I am currently working on an impedance matching transformer to convert from 50 ohms to the high 5000 ohms of the tank circuit that the pockel cell is in. Actually that isn't going to well either. The toroid gets rather hot when I apply 30 watts of 70MHz and doesn't seem to multiply the voltage. The toroid appears to be the correct type: it is green/white, a T130-12.

Try RF Parts Company, in San Marcos, CA - they are a good source for lots
of power transistors.

>mikestewart@4you.net

I have also thought about doing this. I believe that you will have to stick to some type of digital modulation such as CW. If you build a pulse generator you can modulate the pulse position (FM) or pulse width (AM). In both cases the pulse rate must of course be at least two times the highest modulating frequency to allow filtering of the received signal. The RF frequency of the magnatron is fixed by the cavities inside the tube so there isn't much you can do. I haven't tried this but I believe you can lower the power by lowering the voltage and reducing the magnetic field.

If you get things to work I would like to see a posting with the results

Mike,

Have you called East Coast Transistor? They're the official parts outlet for Kenwood. How about calling JAN Crystal, International, or some other crystal maker? I'd estimate you could get one for about $10 from most makers, maybe a bit more for the Kenwood part.

BTW... if you decide the TH-21AT isn't worth fixing, I might be interested ib acquiring it as a spare parts source for my TH-21AT.

An interesting anecdote came from the North Texas Microwave Society a few years back -- I don't have any names, so this may be apocryphal or even an Urban Legend.

It seems that a ham had received what appeared to be a TWT, but with no documentation and only the manufacturer's ID plate attached. As he was a serious microwave experimenter, he wanted to know what he had so he could hook it up and see if it was usable.

So he called the manufacturer.

"Yes, sir, we can provide some information on that unit -- can we get your address and phone number? We'll have to get back to you."

And they DID get back to him. Next morning, Federal agents appeared on his doorstep and confiscated the TWT. It had accidentally been improperly disposed of from one of the Dallas-area high tech skunk works defense contractors, and was classified super top secret, munitions-grade stuff.

They had been looking for it for a while, and just wanted it back.

So you see, it can be useful to call the manufacturer. They're usually quite willing to help identify an unknown part. And now, with the advent of cradle-to-grave responsibility for certain hazardous products, they have a legal requirement to identify and accept for return certain items. For example, the battery-operated ionization smoke detectors that contain a little dab of polonium.

I've often wondered if any significant number of people actually _do_
ship their smoke detectors back to the manufacturer. I have this mental
image of walking into a post office to mail the package. "What's in the
package?" "Smoke detector." "I'm sorry, sir, but we can't accept
nuclear materials for shipment. You will have to contact a bonded,
licensed nuclear materials transporter. What did you say your name is?"
.. (I can only hope it ain't true.)

From: Thad Welch <welchtb.dfee@usafa.af.mil>
Message-ID: <4okte1$jpe@usafa2.usafa.af.mil>
Source record: 105035

I am trying to link two PCs via their serial ports using a wireless network. This is a senior design project for one of my students so I am not looking for a finished commercial product.

Our real interest is in the DSP based receiver so we don't want to spend to much time on the data converters. Most likely this will be a freespace optical link but an RF link would be very similar.

We will be starting at low data rates, 300 bps or slower but would like the ability to easily switch to higher data rates, 19200 bps or higher. We would like to be able to use the full range of data transfer rates available through a PC serial port. We need to packetize the data bits and have read about the AX.25 packet radio system. A number of sources discuss the use of a TNC (Terminal-Node Controller) to interface a PC with a HAM radio. The first component in a TNC is called a PAD (Packet Assembler and Disassembler). As we understand a PAD this bi-directional device packetizes the output data from the PC serial port and then interfaces to a modem/radio which makes up the rest of the TNC. We just need the PAD or any other device/system that will convert a PC serial port output to a bi-directional two wire (one signal and one ground) baseband digital communications system! We can then use this data stream to modulate whatever system we design.

Does anyone out there have a source for a schematic, chip set or kit to allow us to build this PAD circuit? Other solutions or suggestions to help with this data conversion problem would also be appreciated! Thanks in advance!

Thad Welch

Although the generator-powered radio sounds good from an ecological standpoint, I don't see its advantage in usefulness over a battery-operated one unless you're in a location where batteries aren't available. An unused alkaline battery will easily last for several years, longer if it's kept in the refrigerator or freezer. And one will run a radio for several hours. As I recall from an advertisement I saw, the generator-powered radio gives about ten minutes of play time for one of cranking. You may have other things you want to do during a hurricane besides spending 10% of your time cranking.

My old icom battery packs had screws in them. you must have newer units. I have experience with the yaesu batteries. I used a heat gun and pried it apart carefully. Also over the years i have found that it is a loosing battle to go into one of these packs and just change one or two cells. Usually in a week or two after all the work, another cell or two goes bad. you will find it much better to just replace all the cells at the same time. good luck, tom wa5kub take a look at my shack at http://www.cris.com/~tcmedlin

There is a type of solder called "silver solder" available from Maplin
Electronics in England. It may be possible to obtain it elsewhere though.
I have successfully soldered onto battery contacts using this stuff.
A 40W iron should be used and a little bit of the silver solder applied.
Then it should be possible to solder onto this using normal solder. But
don't get the cells too hot as it won't do them any good.

Knife edge difraction is also very prominent at VHF and above. Given a
clean crest on a hill, and some careful aiming, you can cover the other
side remarkably well. This requires directional antennas (due to high
path loss) and a tree-less crest. More deatils in the ARRL handbook.

I have found that to do this right, you need to make a noise power
ratio (slot noise) test. You can get fooled by only looking at 3rd order
IMD.

>tower. Any objective criticism or help, welcome.
>

This begs the question "why do you want to isolate the tower?"

First, insulating any vertically erected structure is a BAD idea from the standpoint of lightning protection. If you do this, you will need some SERIOUS shunt protection to keep lightning surges from being coupled into your shack via the feedline(s).

second, if you want to use your tower to radiate (hence, the need for isolation), you can do some interesting things at the base, while still using "standard" construction techniques. I'm not sure where I read this, but one neat trick is to put ferrite "beads" on each tower leg. The beads reffered to were old transformer cores (big ones) placed around each leg. The article noted that good results wree obtained just by piling a bunch of old transformers around each tower leg. This was for frequencies as low as 160M.

Just some thoughts...good luck,

Joe Haas

Most white noise generators in this range also output over the
entire audio spectrum. If that's acceptable, you can probably
find something in a local library under acoustic testing.

If the generator you need must only output 10 to 30 Hz, I suspect
it will be a pretty sophisticated instrument. Perhaps a sound card
and computer program could generate a pseudo-random (white) noise
only in the desired range.

IMO the easiest approach for you would be to construct a PRBS (pseudo random bit sequence generator) based noise generator, with the appropriate low pass filtering to make the bit sequence look more analog in nature. If you can get your hands on a copy of Horowitz & Hill's _The Art of Electronics_, you'll find some useful info on PRBS generators contained therein. The easiest PRBS implementation would be through the use of National Semis' (soon to be obsolete) MM5437N IC, which is as far as I know still available from Digi-Key; however, I'm not sure that the spectral density of the MM5437's bit sequence will be dense enough for your purposes. If the MM5437N doesn't fit your needs, you could still build your own PRBS generator out of standard TTL or CMOS logic.

Another approach would be to build an analog noise generator based on a reverse biased transistor or diode junction. This type of generator needs amplification to bring the noise up to usable levels, and of necessity needs to use some AC coupling - if you choose this approach, you'll need to ensure that the cutoff frequency due to the AC coupling is at least an octave below your lowest frequency of interest.

Alternative approaches would include stumbling onto an old HP3722 series PRBS noise generator, or finding an old GR1390B analog noise generator in the surplus market. If you go with the GR1390B, you'll probably need to make sure that the low frequency cutoff is acceptable...it's supposed to be 5 Hz, but component tolerance/aging may have pushed the cutoff frequency upward to an unacceptable degree.

Just my $0.02 - good luck.

TGB

Of course, white noise is by definition very broadband; you only want a little over an octave bandwidth. You would do well to specify what you want to happen outside that 10-30Hz band. Assuming that you can come up with an acceptable filter (perhaps just a low-pass filter), it should be trivial to generate a bitstream to feed the filter to get you what you want. A binary shift register sequence should do the job; if you want to ensure some particular statistics (especially important if you are testing something that is both nonlinear and has memory), you may need additional help (email me...). Anyway, clocking at even 1k/sec would give you ample bandwidth to filter, and if the generator is, say, 32 bits, it won't repeat for a very long time...about a month and a half. You should be able to do it in software if you can guarantee that the update rate will be constant, outputting to a parallel or serial port on a PC. Or do it in hardware with a shift register and parity generator.

(Or if you have access to one of my employer's dynamic signal analyzers such as the HP3562, HP35665A or HP35670A, it will do the job directly...)

I have built a preselector from large Siemens K1 pot cores.
Performance on 160 and 80 is impressive; 40m still has too much
loss (not that 16 dB would hurt badly on this band). The upper
bands are for further study.

The 80 meter filter is switched in 4 subranges, each 80 KHz wide
with a flat top. It's a standard top coupled bandpass with
5 pot cores, 5 * 3 variable Cs and 5 * 2 reed relays for
band switching.
If you set it to the 3.5 - 3.58 MHz range, 3.75 MHz is
already way down in the noise of the network analyzer, even
at small bandwidths. :-)

It sure is quite a lot of material and could not be justified
for a commercial general coverage receiver, but if i stick
with the few ham bands it's a completely different picture.

Once you have invested in a good preselector,
upconversion to 40 or 70 MHz looses most of it's charm too;
at an IF of1 MHz or below you need less crystals for a given
absolute bandwidth and the larger low frequency crystals should
promise a better filter IP3. (But this may depend on the cut?)

> 3. 16-pole variable bandwidth distributed IF amp/filter. Novel circuit
> uses groups of 4 pole Cohn varactor controlled crystal filters distributed
> along with MC1590 gain blocks. Provides very low noise figure along with
> 500-5000 khz variable uP controllable bandwidth. Hang agc.

Your AGC may be difficult to stabilize because of the large
group delay. A friend of mine cascaded some mechanical filters
on 200 KHz and had quite a lot of work until the AGC
worked properly. The problem were signals exactly on the
filter skirt.

> Note, this is all real hardware- all but synthesizer have schematics. I
> currently have the preselector, Makhinson front end, IF, etc being driven
> by a crystal mix LO using 5mhz VFO mixed up to needed freq using crystals-
> just like in old DRAKE R4C- hence name R4-DMOS. Right now PLL/DDS is
> sitting next to receiver, waiting for uP controller to be built.

I also built an AD7008-based DDS and a 1:1 cleanup PLL that can
be controlled by 4 bits of a PC line printer port. DDS+PLL fit
on a 2 * 2 inch board and work nicely at 5-5.5 MHz.

The spurs of the AD7008 are some 8 or 10dB worse than those of
an Harris HSP45106 DDS + HI5721BIB ECL-DAC,but the Harris is not
so much better that we could get rid of the clean up PLL.

I did this for a customer so I cannot give the design away,
but the AD7008 control program for the PC is available.

I think an interesting ham receiver might be the following:

1. sharp preselector with reed relais or maybe varicaps

2. mixer with 4*SD210210 or other DMOS-fets

3. first oscillator has steps of 200 KHz;
could be crystals if you are interested in some bands only.

4. post amplifier with AGC like the differential amplifier
design published by Rohde. AGC voltage should be taken by
amplified 1 MHz IF.

5. IF filter near 1 MHz, 300 KHz wide. (HighPass/LowPass)
No crystals.
The bandwidth is necessary so that we can implement
a decent noise blanker. (neglected by most designs)

6. delay line + noise blanker gate
(in the style of DJ7VY 's design from 15 years ago)

7. amplify and mix down to say 50 KHz.
Current feedback opamps have IP3 of 45..50 dBm at 1 MHz.

8. 2nd oscillator is DDS from 850 to 1050 KHz. Sideband
noise of the cleanup vco is hard to mess up at this frequency.
At more than 150 KHz off the carrier it's even less important.

9. amplify the signal at 50 khz. Use op37 or similar opamp.
You may bandlimit the signal somewhat but stay away from
active filters unless you know exactly what you are doing.
(Some types build up huge voltages at internal nodes so
they saturate when you don't expect it.)

10. digitize with Burr Brown PCM1760 / DF1760 20 bit A/D converter
or similar. 16 Bits should be enough.

11. feed into Motorola 56002 evaluation kit. It's dirt cheap
and contains all hard- and software required.

The connection requires a shift register that is memory mapped
to the free socket.

The evaluation kit has an a/d converter of it's own that
you may use instead of the Burr-Brown, but it is less than
excellent. It may be a good start, however since you
don't need to do any digital hardware design. I cannot say
from memory if it can do a 50 KHz sample rate.

12. Run digital filters with independent upper & lower edges
and notches as you like. Examples are in the eval kit docs.

13. AGC can be implemented by multiplying the samples with a
variable that keeps track of average signal strenght.
There is no need to loop the AGC around a filter, so
there is no stability problem.

14. Demodulate by multiplying with a 50 KHz sinusoid.

15. Write the samples to the onboard d/a converter.

16. Plug your headphones into the demo board.

Another possibility is to use a broad-spectrum noise generator, and then put it through some active bandpass filters. The "Active Filter Cookbook," published (I think) by SAMS, inc., has ripoff circuits (that is, with all the parts assigned values) and complete instructions (and worked examples) how to make such things given only op-amps, resistors, and capacitors. However, it contains no "brick wall" filters that pass no energy outside the given band. But a sixth order highpass at 10 Hz followed by a similar lowpass at 30 Hz might be good enough for you, and the book makes it clear how to design one. (Whether Butterworth, Bessel, or 1-, 2-, or 3-dB dips Chebyshev, by the way. And it shows you what the difference between them is.)

It would require a couple of quad op-amps and a small handful of Rs and Cs.

Polypropylene would be best as an insulator but make sure it
is BLACK for UV resistance (common stuff is yellow). But, why not
use a couple of cheap glass insulators?

Braided Nylon is NG because it deterioriates pretty fast.
Dacron is much better and stretches less.

Build your own PA stage. Motorola makes RF MOSFETS that will do the job, and provide lots of application notes for high power broad band VHF amplifiers using MOSFETS. With 30 W drive, a push-pull output stage is probably all you need.

The hard part in designing RF power amplifiers is to get the input and output impedance matching networks right. Since you want to drive a 5 k load, you should design the output matching network for a Zl = 5k instead of the usual 50 ohm. No reason to use a step up transformer, that is what the matching network is supposed to do (along with harmonic suppression, which may not matter in your application).

Call on some of your friend in Electrical Engineering; they should be glad to assist. Good Luck!

Grab one of those small radio shack portables that receives AM, FM and VHF-TV audio. They are about $60 or 70, run off two AA cells. Then grab a few pair of AA lithium cells (rat shack or other sources) and a small AA powered flashight. Stuff the whole mess into a few zip bags and you have a very useful receiver setup for such situations that should have a 10 year shelf-life. Stick a Standard C108A/C508A in the same bag and you're really set.

The stereo multiplex generator chips I've heard of are both from more obscure japanese companies. Rohm has the BA1404 (and a BA1405) and NJR has the NJM2035.

The BA1404 is what is used in the Ramsey FM-10 and other "license free broadcaster" kits. (It includes a transmitter section). There have been articles on the FM-10 in Popular Electronics a couple of years ago and a construction article on a BA1404 based transmitter in the July 1992 Radio-Electronics magazine. Also covered in Don Lancaster's "Hardware Hacker" column in Radio-Electronics around that date.

The NJM2035 is what I've heard is used in the FX-Wave CD to radio convertor that you can buy off the pegboard at your local discount store. Last I knew, Digikey sells NJR but I didn't find the part in the catalog I looked in.

This in an outstanding idea.

Be sure to use the usual trick of putting two diodes in series with
the polarity reversed to cancel out distortion. This is really important.

For the inductors, I would use Fair-Rite #67 toroids, 1/2 inch O.D.

Link couple the toroids to provide for going varactor tracking (capacitive
coupling screws up tracking).

See my 1996 IEEE Frequency Control Symposium paper for some ideas on
synthesizers.

A 10-39 MHz. VCO sounds like you're talking about a 9 MHz. IF with
a receiver tuning range of 1 to 30 MHz. That is very questionable
from the viewpoint of low order mixer intermods. With your preselectors,
you ought to use a 455 kHz. first IF.

I don't have the schematic anymore, but a few years ago I had a similar problem and traced it to a shorted bypass cap (.001 pf I believe) on the carrier shift board. I think it was near one of the varacter diodes.

Good Luck,

Charlie AA7NQ

I started reading your post and thought I had the answer, then bam I
finished reading and realized I was as lost as you.
I've never connected a HF rig but I have connected several VHF scanners.
It really sounds like an alternator whine by your description, but pushing
in the clutch to make it go away rules that out. Unless somehow the
transmission is not properly grounded, and there is something really
strange going on.
I've found that Black Magic, smoke and mirrors,etc. seems to be involved
with solving RF-mobile problems.
Did you ground your exhaust manifold? Your transmission? Oh, I'm sorry
you were trying to avoid trying everything !!
Let me know what you find. I'd be very interested.
Good luck,
H Higgins

GPS units also have a maximum altitude (so it cant be used in a missle).
I used to send up 5-6 ft. weather ballons for the forest service, and as I
recall, we got up to 20,000 ft in a half hour or so. So your commercial
GPS unit would be of no use after 30 min at most.
GPS's also have a maximum acceleration limit, if I'm not mistaken, but I
doubt if any balloon will ever reach that limit.
Good luck
H Higgins

The Racal 6790GM used a high level mixer (about 2W of LO). This was
fed via a filter directly from the antenna. The mixer consisted of
4 mosfets in a bridge. I have had to fix two of these mixers.

The receiver did NOT desense.

As I am currently embarking upon rebuild number 3 of my 2m/70cm repeaters, I'm looking for interesting and useful (and relatively easy) projects to make the system better.

I'm especially looking for audio tailoring circuits and audio delay lines, but anything useful will be added to the "Things To Do" notebook for future consideration. Does anyone have any suggestions? To save bandwidth on the newsgroup, please reply via e-mail to the below address. Thanks for any assistance anyone can provide.

I've been very happy with the Dacron line I've gotten from
Synthetic Textiles (somewhere around Ventura, CA), who advertise
in CQ magazine. About the only down side is that you have to
order long lengths from them, so you might want to split the
order with friends. But I've left their line out in the weather
for years and come back to untie knots that came out easily --
extremely little hardening and no apparent deterioration. Your
climate may vary, to paraphrase a common disclaimer. Their line
has a black braided jacket that lets it slip pretty easily
through holes and makes it generally easy to handle. It's such
nice line I've used it for lots of things besides just holding
up antennas!

> 73 Tom
Tom,

How fast is fast? For example, most open frame relays are adequate.
My
SB-220 amp has a 3P2T open frame relay, which works fine for AMTOR,
PACTOR, etc
as-is. Have used it for years on these modes. I have also measured the
t/r
times of my TS820, which has two relays, one of them being a 4P2T job.
The
whole system switches in under 15 mS, again, plenty fast enough for
those modes.
So my suggestion is, use any reasonable relay, not oversized, for the
job.
There seems to be a lot of myth out there about "fast switching",and
that relays
cannot do it. Wrong in many cases. I once worked a ham on AMTOR who
had just spent hundreds of dollars on a PIN diode T/R switching box for
use with his
SB-220. When I told him I was also using a SB-220 which was
essentially in
stock condition, he told me that what I was doing was impossible! Ah
well,
no one likes to admit he's been zapped by the marketeers again...

Hi Jack, Add stub matching to that pot. The theory of stub matching has been forgotten. Stubs need not be pieces of transmission line. Functionally, they can be a capacitor or an inductor. I use stub matching theory and one single variable capacitor across the ladder-line at the operating position to achieve a 50 ohm SWR of 1:1 on *all* HF frequencies with a 102 ft. dipole. It is the easiest, most efficient antenna matching technique that I know of. Why in the world has it been discarded? It works as well and usually better than an antenna tuner and costs a lot less.

Hello!

I've got some awesome news that I think you need to take
two minutes to read if you have ever thought "How could I make
some serious cash in a hurry???" , or been in serious debt, ready
to do almost anything to get the money needed to pay off those
bill collectors. So grab a snack, a warm cup of coffee, or a glass
of your favorite beverage, get comfortable and listen to this
interesting, exciting find!
Let me start by saying that I FINALLY FOUND IT! That's right!
I found it! And I HATE GET RICH QUICK SCHEMES!! I hate those
schemes like multi-level marketing, mail-order schemes, envelope
stuffing scams, telephone number scams... the list goes on forever. I
have tried every darn get rich quick scheme out there over the
past 12 years. I somehow got on mailing lists for people looking
to make money. Well, when I was a teenager, these
claims to 'get me rich quick' sounded irresistible! I would shell
out $14.95 here, $29.95 there, $24.95 here, and another $49.95
there. I had maxed out my new Circuit City Card AND my Visa...I
was desperate for money!! So, I gave them all a chance but
failed at every one of them! Maybe they worked for some people,
but not for me. K MAIL in the
trash when I got the mail. I recognized it right away. I can
smell a money scam from a mile away these days, SO I THOUGHT....
I thought I could sniff out a scam easily. WAS I WRONG!!
...I LOVE THE INTERNET!!!

I was scanning thru a NEWSGROUP and saw an article stating to
GET CASH FAST!! I thought..."Here on the Internet?? Well, I'll
just have to see what schemes could possibly be on the internet."
The article described a way to MAIL 5 DOLLARS/POUNDS TO ONLY
FIVE PEOPLE AND MAKE $50,000 IN CASH WITHIN 4 WEEKS! Well,
the more I thought about it, the more I became very curious. Why?
Because of the way it worked AND BECAUSE IT WOULD ONLY COST ME
25 DOLLARS/ POUNDS (AND FIVE STAMPS), THAT'S ALL I EVER PAY....EVER!!

Ok, so the $50,000 in cash was maybe an tough amount to reach,
but it was possible. I knew that I could at least get a return
of $1,000 or so. So I did it!! As per the instructions in the
article, I mailed out ('snail mail' for you e-mail fanatics) a
single dollar bill to each of the five people on the list that
was contained in the article. I included a small note, with the
dollar, that stated "Please Add Me To Your List." I then removed
the first position name of the five names listed and moved
everyone up one position, and I put my name in position five of

the list. This is how the money starts rolling in! I then took this revised article now with my name on the list and REPOSTED IT ON AS MANY NEWSGROUPS AND LOCAL BULLETIN BOARD MESSAGE AREAS THAT I KNEW. I then waited to watch the money come in...prepared to maybe receive about $1000 to $1500 in cash or so....
But what a welcome surprise when those envelopes kept coming in!!! I knew what they were as soon as I saw the return addresses from people all over the world-Most from the U.S., but some from Canada, even some from Australia! I tell you, THAT WAS EXCITING!! So how much did I get in total return? $1000? $5000? Not even!!! I received a total of $23,343!!! I couldn't believe it!!

I now have a brand new black sports-car to speak for, due to all of this!! Now,after almost 8 months, I am ready to do it again!!! So maybe it was possible to get $50,000 in cash, I don't know, but IT COMPLETELY DEPENDS ON YOU, THE INDIVIDUAL! You must follow through and repost this article everywhere you can think of! The more postings you achieve will determine how much cash will arrive in your very own mailbox!! It's just too easy to pass up!!!

Let's review the reasons why you should do this: The only cost factors are for the five stamps, the 5 envelopes and the 5 five dollar/pounds that you send out to the listed names by snail mail (Postal Service Mail). Then just simply repost the article (WITH YOUR NAME ADDED) to all the newsgroups and local BBS's you can. Then sit back and, (ironically), enjoy walking (you can run if you like! :o) down your driveway to your mailbox and scoop up your rewards!! We all have five dollars to put into such an easy effortless investment with SPECTACULAR REALISTIC RETURNS OF $15,000 to $25,000 in about 3-5 weeks! So HOLD OFF ON THOSE LOTTERY NUMBERS FOR TODAY,EAT AT HOME TONIGHT INSTEAD OF TAKEOUT FROM McDONALDS AND INVEST FIVE DOLLARS IN THIS AMAZING MONEY MAKING SYSTEM NOW!!! YOU CAN'T LOSE!!

Remember: it's only FIVE dollars! Didn't you ever made the mistake to help someone with 5 dollars, never got it back and thought "What's 5 bucks anyway?" In this case it's a ticket to a LOT of money!

So how do you do it exactly, you ask? I have carefully provided the most detailed, yet straightforward instructions on how to easily get this underway and get your cash on its way. SO, ARE YOU READY TO MAKE SOME CASH!!!?? HERE WE GO!!!

*** THE LIST OF NAMES IS AT THE END OF THIS ARTICLE. ***

OK, Read this carefully. Get a printout of this information, if you like, so you can easily refer to it as often as needed.

INSTRUCTIONS:

1. Take a sheet of paper and write on it the following:
"Please add my name to your list". This creates a service out of this money making system and thus making it completely legal, anywhere in the world. ANYWHERE? Yes, all the postal services are a member of the UPU, a worldwide postal organisation. They all have the same rules about sending money. You are not just randomly sending a dollar to someone, you are paying one dollar for a legitimate service.

2. Make sure you include your name and address. I assure you that, again, this is completely legal! You can inclose a little note to just say 'hi' as the new member of this 'money-family'! For a neat little twist, also write what slot their name was in: "You were in slot 3", Just to add a little fun! This is all about having fun and making money at the same time!

3. Now fold this sheet of paper around a dollar bill (no checks or money-orders, or all the money will go to cashing them), and put them into an envelope and send it on its way to the five people listed. The folding of the paper around the bill will insure its arrival to its recipient. THIS STEP IS VERY IMPORTANT!! You don't want your money to go to greedy postal-workers, do you?

4. Now listen carefully, here's where you get YOUR MONEY COMING TO YOUR MAILBOX. Look at the list of five people; remove the first name from position one and move everyone on the list up slot one on the list. Position 2 name will now move to the position 1 slot , position 3 will now become position 2, 4 will be be 3, 5 wil be 4. Now put your name, address, zipcode AND COUNTRY in position 5, the bottom position on the list.

5. Now upload this updated file to as many newsgroups and local bulletin boards' message areas & file section as possible. Give a catchy description of the file so it gets noticed!! Such as: "NEED FAST CASH?, HERE IT IS!" or "NEED CASH TO PAY OFF YOUR DEBTS??", etc. And the more uploads, the more money you will make, and of course, the more money the others on the list will make too.
LET'S ALL TAKE CARE OF EACH OTHER BY BEING HONEST AND BY PUTTING FORTH 120 PERCENT INTO THIS PROFITABLE & AMAZING SYSTEM!!!
You'll reap the benefits, believe me!!! Set a goal for the number of total uploads you'll post, such as 15-20 postings or even more! There are realy no limits, since there are far more newsgroups worldwide then you ever can post to! Always have a goal in mind!!! If you can UUE-encode the file when uploading, that will make it easier for the people to receive it and have it downloaded to their hard drive. That way they get a copy of the article right on their computer without hassles of viewing and then saving the article from the File menu. Don't alter the file type, leave it as an MS-DOS Text file. The best test is to be able to view this file using Notepad for Windows 3.x or WordPad for Windows '95. If the margins look right without making the screen slide left or right when at

the ends of the sentences, you're in business!

6. If you need help uploading, simply ask the sysop of the BBS, or "POST" a message on a newsgroup asking how to post a file, tell them who your Internet provider is and PEOPLE WILL ALWAYS BE GLAD TO HELP. I would try to describe how to do it but there are simply too many internet software packages with slightly different yet relatively simple ways to post or upload a file. Just ask for help or look in the help section for 'posting'. I do know that for GNN, you simply select 'POST' then enter a catchy description under the subject box, choose 'ATTACH', selecting 'UUE' and NOT 'TXT', then choose 'Browse' to go look for the file. Find your text file CASH.TXT and click on it and choose 'OK'. Place a one line statement in the main body section of the message post screen. Something like "Download this to read how to get cash arriving in your mailbox with no paybacks!" or whatever. Just make sure it represents its true feasibility, NOT something like... "Get one million dollars flooding in your mailbox in two days!" You'll never get ANY responses!

7. And this is the step I like. JUST SIT BACK AND ENJOY LIFE BECAUSE CASH IS ON ITS THE WAY!! Expect to see a little money start to trickle in around 2 weeks, but AT ABOUT WEEKS 3 & 4, THE MONEY STORM WILL HIT YOUR MAILBOX!! All you have to do is take it out of the mailbox and try not to scream too loud (outside anyway) when you realize YOU HIT THE BIG TIME AT LAST!!

8. So go PAY OFF YOUR BILLS AND DEBTS and then get that something special you always wanted or buy that special person in your life (or the one you want in your life) a gift they'll never forget. ENJOY LIFE!

9. Now when you get low on this money supply, simply re-activate this file again; Reposting it in the old places where you originally posted and possibly some new places you now know of. Don't ever lose this file, always keep a copy at your reach for when you ever need cash. THIS IS AN INCREDIBLE TOOL THAT YOU CAN ALWAYS RE-USE TIME AND TIME AGAIN WHEN CASH IS NEEDED!

HAVE FUN WITH IT!!!

The list will become more valuable as it grows in size. This is a service. IT IS PERFECTLY LEGAL! If you have any doubts as to the legality of this service, please refer to Title 18,Sections 1302 and 1341 of the US Postal Lottery Laws.

NOTE: Make sure that you retain EVERY name and address sent to you, either on computer or hard copy, but do not discard the names and notes that people send to you. This is PROOF that you are truly providing a service, and should the I.R.S. (=US Tax Agency) or some other government agency question you, you can provide them with this proof!

AGAIN, HONESTY IS THE BEST THING WE HAVE GOING FOR
US ON THIS PLAN.

Good Luck!

P.S.: You might expect me to say in this line that 'you must join, otherwise a lot of bad things will happen to you!', or 'if you don't send money yourself, you'll be cursed' or something like that. Well, I'm not. Remember: this is not about threat and super-stition but this is all about honesty and reality. And fun!

3446. Sizing toroid core for use in tube pi-net?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-31 00:00:00 UTC
From: dgf@netcom.com
Message-ID: <dgfDsA9L9.82v@netcom.com>
Source record: 104991

Is there any sort of rule-of-thumb on choosing the correct core size for a toroid core tube used as substitue for air core coil in a tube-output HF final/amplifier section? For example, at 7 MHz, 700 volts/300 mA (maybe 100W output...) would a T200-2 core be required, or could a smaller one be used, or would the T200-2 even be sufficient? If you wanted to make a multi-band output network (with tapped coil), would you need to size the core for the highest operating frequency (assuming similar tube operating point for each frequency)?

Any advice appreciated,

73 Dave WB0GAZ dgf@netcom.com

Been there, tried it. I usually end up welding the "welder" to the battery :^)
The connection, if successful, was pretty weak.

> On a related topic, I also have a bunch of nicads with tabs for
> push-on connectors. I need to save some space by soldering to the
> tabs. Of course, they won't solder (now I know why they were cheap),
> probably stainless. Is there a flux for soldering stainless?

Sand the area you want to solder to with some fine sandpaper first (~200-400 grit). If you are in a bind, you can use a pencil eraser. Sometimes scratching the surface with an awl or screwdriver tip will provide a rough surface for better adhesion.

*** Use a *HOT* iron! You do not want to heat up the battery too long. ***

This is one of the few times I pull out my Weller soldering *gun* (the one with the headlight). Or a 75W or greater soldering iron. The large thermal mass of the battery will suck the heat away from smaller irons.

The standard Weller-type soldering station, or 20-40W pencil iron, is not powerful enough. (although they work for AAA size cells).

Pre-heat the tip so it is nice and hot before starting. Make a little solder "pad" on the battery first. Then solder your PRE-TINNED wire to the solder "pad". Trying to solder the wire at the same time requires three hands, and you may melt the wire insulation while doing it.

When soldering the tops of the cells, be extra careful. Don't cover up the vent hole and watch that any excess solder does not run off and short to the case (If it does, put on your eye protection and grab your Soldapuldt!) You should have your solder sucker loaded and ready to go in case of just such an accident.

Also, watch that your length of solder does not come in contact with any "naked" parts of the battery pack.

It takes a little practice, but you will get the "feel" of it.

Isn't the President Lincoln the "export" version of the Uniden HR2510
10 meter Amateur transceiver?

You can get Uniden's parts department phone number on their web site
at:

www.uniden.com

If they can't help on the Lincoln service manual, an HR2510 is
probably fairly close if these radios are indeed different shades of
the same color.

3450. Announcing: EzPacket Ver2.20 for PMP/BayCom

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-31 00:00:00 UTC
From: William Kresl <wmkresl@townsquare.net>
Message-ID: <4olj2u$2ro@tribune.concentric.net>
Source record: 105064

Announcing: EzPacket Version 2.20 for PMP/BayCom

From: Bill-WB9BBC

I just received this post from Frank Domina, N9MXI, the author of the
EzPacket program for the PMP/BayCom modems. He can NOT be reached via
e-mail, so I am posting this note for him (read below). If you wish to
reply to him, it would be best to respond to THIS NEWSGROUP THREAD!

Frank has attached his NEW EzPacket Version 2.20 program to his note
(size=71Kbytes). Frank's release notes appear below. I will be happy
to distribute this program via E-MAIL for him if you would:

o Send E-MAIL via INTERNET to ME (WB9BBC): wmkresl@townsquare.net
(Or, via PACKET RADIO: WB9BBC @KD9JK.WI.USA.NOAM).

o Make the SUBJECT line of the e-mail: EZPACKET
(so I can sort thru the mess).

o No text body necessary, but if you wish you can include
your name/call/QTH. Make sure YOUR internet E-MAIL address
is CORRECT (I hate bounced back mail).

o I will send out programs on FIFO (first-in-first-out) basis, so
be patient if I don't get right back to you.

o The Program will be sent as a ZIP attachment (MIME), no decode
necessary. Just know where this ZIP program will go on YOUR system!
(I CAN NOT send the file as Packet RADIO mail, but I may send out
as a 7+ encoded file at a later date).

I haven't tried out this program yet, my BayCom modem is not hooked up.
If you have any comments, problems or bug-reports then please pass them
along thru the newsgroups. Cheerio!

Wm Kresl
WB9BBC (@KD9JK.WI.USA.NOAM)
wmkresl@townsquare.net
Delavan, WI USA

Hello. If you wouldn't mind putting the following out on a newsgroup, that
would be great. (For some reason, I cannot get news postings through our
firewall at work)

IF YOU DON'T MIND, PLEASE POST THIS to the "rec.radio.amateur.homebrew" and
"rec.radio.amateur.packet" news groups:

EzPacket is FREE DOS-based software and is for use with PMP and Baycom modems
and has multiple windows/connections support. It can be downloaded from from
the Precision BBS at (847) 985-9544. The name of the file will be EZPKT???.ZIP
where ??? is the version. The latest version is EZPKT220.ZIP. A User's Manual
is available from the author for a very minimal fee, however there is also
decent on-line help. Version 1.7 was widely distrubuted and there have been
recent updates since then as described below from the readme.txt that is
included with the software:

Version 1.8.x beta releases:
- Fixed BUG that did not display the session number correctly
when prompting for the session's upload file name.
- Removed prompt when FORCING an in-progress disconnect.
- Added display of found LPT and COM ports when editing config.
- Remembers and uses the last video mode (25 vs 43/50 line mode)
unless told otherwise on the command line (run EzPacket /?
for help)
- Updated the ALT-A "about" screen again
- Fixed bug that could cause nodes or stations heard lists to
become corrupted after clearing the lists.
- Added monitoring station include/exclude filters. The list is
"H" in the ALT-O options, and it is enabled for each window
under "D" then "window number" in the ALT-O options.
- Added clearing scrollback buffers (see ALT-H help for key)
- Added TAB/BackTAB to switch windows
- Added ability to take action on key pressed when exiting
Help Screen
- Fixed failure to write scrollback buffer or current window
(ALT-F & ALT-W) I think this bug was only in previous beta
releases.

Version 2.0:
- Added optional message types to filter when monitoring
- No longer tries to display data from unknown packet
tranport formats
- Added more config options for sound [(1) off, (2) on,
(3)only within text (typed or received), and (4) only from
user interface.)
- Most control chars are now changed to printable chars in the
scrollback buffer (i.e. CTRL-A displays as ^A, etc.):
+ Tabs still get translated to the appropriate number
of spaces.
+ Backspace now overwrites the previous character on the
same line.
+ Other printer control characters such as <VT>, <CR>,
<LF> and <FF> are NOT translated to printable
characters.
+ Bell chars beep (if enabled in configuration) when
FIRST "displayed" AND are STRIPPED from scrollback
buffer so quiet when scrolling.
- When typing in data, BELL chars (CTRL-G) display as " ",

TAB chars (CTRL-I) display as " ", and all other control
chars will DISPLAY as the character representing the typed
char + hex 80, BUT the true typed characters will actually
be taken as the input. For example CTRL-A, which is hex 01,
will be DISPLAYED as the character that is hex 81, which
happens to be "", but the typed CTRL-A will be taken as the
input. This is to simplify the user input line and make
normally undisplayable characters visible when typing.

```
Version 2.1:
- Fixed bug that cause lock-up if trying to display a control
character (i.e. ^D) when there was only room for 1 character.
- Removed redundant line in remote commands help screen.
- Added new ZOOM option (ALT-F10) to toggle session display
between windowed and full-screen.
- Added new /D[a] DEBUG option (run EzPacket /? for usage)
that dumps all received data in its raw form to a binary
file (ezpacket.dbg). The format of the variable-length
records in the file are as follows:
<2-ByteNumberOfDataBytes><DataBytes><0x7E><0x7E><0x7E>
The three 7E bytes are added for easier visual inspection
when viewed with a binary file viewer.
NOTE: This mode opens/writes/closes the debug file with
every received packet, therefore performance may
be degraded on slower computers with slower disks

Regards,

Frank Domina, N9MXI

<snip>
>You can calculate the flux from the currents in the windings too,

Thanks for the clarification Kevin. It sounds like the proper way to monitor flux change in a core is to monitor the voltage across a winding, as according to Faraday, this voltage must be proportional to dB/dt, regardless of saturation.

In case of saturation, B no longer follows H. So, to check for saturation in a toroid inductor in a output network of a transmitter, I would measure the current into the winding with a current probe hooked up to an oscilloscope, and display it against the voltage across the winding.

If v(t) is proportional to di(t)/dt at all times, the core is free of saturation. Saturation would show up where i(t) gets large, resulting in a collaps of v(t). Does that sound reasonable?

Wilbert, ZL2BSJ.

That's much too high a ratio for a single transformer.
A circuit like this really needs a tuned tank for the
impedance transformation. Your concept of modifying a
6 Meter amplifier is probably workable, although at this
point, you might want to just replace the transformer
with the appropriate tank components.

Dacron is the best of all these ropes. It is often available
at a reasonable price at larger hardware/building supply centers,
but it wil probably be labeled "polyester", not Dacron.

Polypropylene and nylon should be avoided for this use; they
are inferior to Dacron/polyester in every way.

You are quite right but not all polyester is good quality. It's tough to "figure". If your suggested sources don't work, try a local boating supplies store, also called chandlers. The better materials are found there.

I'm not a fan of polyproylene, either. It's quite common though, and somewhat better than nylon under continuous exposure to the sun.

Nice comments, Jack.

That all sounds reasonable, but the problem is almost never saturation (unless it's a HF pulse transmitter or a high permeability ferrite core, hi).

3456. Re: Class-C RF transistors ?

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-31 00:00:00 UTC
From: Lennart Nilsson <ln@hagagymnasiet.norrkoping.se>
Message-ID: <4omgi5$kq3@simba.lejonet.se>
Source record: 105070

The linearity of an RF transistor depends, among other things, on
die-size. To find out at what level it can be used for SSB you
wire it up, bias it for a low idling current and compare drive
and output powers. When you reach 1 db of compression the IMD
starts to build up. Better still is to run a two-tone test with
an analyzer.

3457. UHF and Microwave homebrew

Newsgroup: rec.radio.amateur.homebrew
Date: 1996-05-31 00:00:00 UTC
From: jcarey
Message-ID: <4omqs6$3bi@news-2.csn.net>
Source record: 105071

Hi All,

Is anybody in this group doing any homebrewing of gear in the UHF and Microwave bands? Specifically, I'm interested in working in the 915 MHz and 1280 MHz bands.

I'd like any first hand advice that you might have, but I'm especially interested in sources
for affordable oscillators, mixers and swtiches. I was thinking I'd use connectorized components for the really high frequency stuff and interconnect them with semi-rigid coax. If I absolutely must, I can cut a microstrip PC board on FR-4, but I'd rather not, since that
would be so hard to take measurements on later.

Also, I'm wondering what kind of phase noise I can expect from oscillators at in these bands. For typical narrowband FM do I need to use a synthesized oscillator, or would a simple negative resistance transistor oscillator be sufficient?

I know where to get this stuff commercially, but everybody seems to be asking an awful lot of money for it!

Thanks in advance,

Joe Carey

How long is the dipole? How heavy is the wire you intend to use? How
long does the rope have to be? Overall, nylon rope works pretty well.
I have a 160 Meter dipole held up by thick string nylon. You can pick up
a spool at a Builders Square, Lowes, etc for 4-5 bucks. About 230 feet of
this heavy string. I double it, it lasts 3-4 years in very harsh northern Indiana
weather. I guess the rule of thumb is to get only what you need. Some of
this 'parachute cord' will outlast you and your QTH, but it's very salty.

The unqualified use of baluns is what has set the Amateur community
back thirty years. Overlooking the advantages and versatility of
link coupling on the basis of its age is akin to replacing the
family sedan with a hovercraft. ;)

Another method is to measure the distortion products as the signal
is increased and note the point at which they begin to rise.

You might also check with some of the RC car types.

The racers think the tabs have to much resistance, so they always solder up thier own packs using flat braid & matched cells.

Of course they abuse the cells (rapid charge & discharge) , so if life in "normal" service were reduced by 50% they probably wouldn't notice it.

Well, there are insulators on the end of the antenna, but I'll need some
rope to tie to the other end of the insulators to suspend the antenna in
the air.

A few years ago at Dayton I witnessed a guy who'd modified a standard microwave oven to do ATV. The bandpass was good enough for color and he'd modified a satellite receiver down-converter and receiver to receive the signal. It looked pretty good, especially since he was able to run about 250 watts cleanly modulated on a 600 watt microwave oven.

It was kind of comical since he used the oven cavity as the location for the pair of 4CX250b tubes for the modulator. Just open the interlocked front door for access. And of course the mechanical timer acted as a time-out-timer.

If seems that if it could do video, it'd be pretty easy to do wideband FM. You'd probably have to stay wideband, since the frequency stability of a magnetron is pretty poor.

Basically the 4CX250b's current modulated the magnetron. I think he was able to pull the frequency about 10 MHz this way.

I remember also that he won the "Great Ideas" contest in one of the major RF magazines. RF Design, or one of those.

Surplus Sales of Nebraska has dozens of vacuum relays. I checked them out
at Dayton. Expect to pay $80 for a good one with less than 8ms delay.
Also. Fair Radio Sales has some but they appear to be slower. 73

Hi Chris, I have begun to suspect the ABS system is causing a
similiar problem in my S10. Does anybody know if the clutch
position is sensed by the ABS?

Hello everything.

(knowledge of the geography or mileage of northern and/or southern
California will be helpful in answering this post. Sorry I don't have better
numbers)

I don't know if this is a reasonable place to post this or not. But because
I can't think of where else to post, I'll give this a shot.

This post is inspired by the contrast between my various observations
and my father's theories. Also my various observations contrast with each
other a little.

Can anyone tell me what the facts are about how far FM radio can reach
in the United States? There must be federal regulations on the power of
the stations and physical limitations due to either the curvature of the earth
or just the distance which would make it impossible for a signal to
stretch beyond a given distance. I am in San Diego and am able to
pick up a Los Angeles station (K-Earth) load and clear, although it may
break up every now and then. If you live in this area or are familiar
with Southern California, you know what distnace that is. (Half way Oceanside
to TJ, I'm in LaJolla). I don't know, I guess it's between 100 and 150 miles
from here to LA

There's another station (91x) whose broadcast tower is on the hills of Tijuana
and supposedly doesn't abide by the FCC rules because it's in Mexico..
So it has a super-strong signal, and my brother said that he was actually able
to hear them once or twice in Santa Barbara (250 miles?).
My father says that's doubeful due to physical limitations.

There's a third station (102.1) which is located in Oceanside, border between
San Diego and Orange counties. That's probably only 100 miles from L.A.
Maybe less, depending on how you count Los Angeles. Would you expect
to be able to hear that station well into LA?
I have no problem (or little problem) getting them here in LaJolla
(30 miles?) but in Hillcrest (another 15 -- 45 or 50 miles?) the signal
started to break up.

Finally, there's one more station (100.3 I think) which is KBAY I think
in the San Francisco bay area, which I have been able to hear all the way
down 101 to Gilroy or even due East of Monterey.
I am not sure how far this is -- maybe 130-150 miles?

My father has assured me that there MUST be a repeated somewhere in
order for that signal to reach so far.

So what's the deal? Is there a magic number of miles (1) that an
average-to-strong signal (2) can travel and be picked up by a reasonably
good receiver? (3)
What about a station which doesn't pay attention to FCC limits? (4)

Please let me know if this should be re-posted elsewhere or if I should
look in a reference at a library.

Thanks

-Allan
allan@carhart.com

(1) assuming average weather conditions --probably more sunny days than cloudy
ones in North and South California
(2) assuming the radio station is within the FCC limits but at the high end
(3) boom box with analog tuner and/or high-end walkman with digital tuner
and/or car radio with digital tuner
(4) I would assume that 91x (91.1) doesn't exceed federal limitations
by too much due to either financial limitations or Mexicon Government limits.
